ThinkSystem SR530
Maintenance Manual

Machine Types: 7X07 and 7X08
Note

Before using this information and the product it supports, be sure to read and understand the safety information and the safety instructions, which are available at:

In addition, be sure that you are familiar with the terms and conditions of the Lenovo warranty for your server, which can be found at:
http://datacentersupport.lenovo.com/warrantylookup

Tenth Edition (May 2020)

LIMITED AND RESTRICTED RIGHTS NOTICE: If data or software is delivered pursuant to a General Services Administration (GSA) contract, use, reproduction, or disclosure is subject to restrictions set forth in Contract No. GS-35F-05925.

Safety inspection checklist

Use the information in this section to identify potentially unsafe conditions with your server. As each machine was designed and built, required safety items were installed to protect users and service technicians from injury.

**CAUTION:**
This equipment must be installed or serviced by trained personnel, as defined by the NEC, IEC 62368-1 & IEC 60950-1, the standard for Safety of Electronic Equipment within the Field of Audio/Video, Information Technology and Communication Technology. Lenovo assumes you are qualified in the servicing of equipment and trained in recognizing hazards energy levels in products. Access to the equipment is by the use of a tool, lock and key, or other means of security, and is controlled by the authority responsible for the location.

**Important:** Electrical grounding of the server is required for operator safety and correct system function. Proper grounding of the electrical outlet can be verified by a certified electrician.

Use the following checklist to verify that there are no potentially unsafe conditions:

1. Make sure that the power is off and the power cord is disconnected.
2. Check the power cord.
   - Make sure that the third-wire ground connector is in good condition. Use a meter to measure third-wire ground continuity for 0.1 ohm or less between the external ground pin and the frame ground.
   - Make sure that the power cord is the correct type.

   To view the power cords that are available for the server:
   a. Go to:
      
   b. In the Customize a Model pane:
      1) Click **Select Options/Parts for a Model**.
      2) Enter the machine type and model for your server.
c. Click the Power tab to see all line cords.

\begin{itemize}
\item Make sure that the insulation is not frayed or worn.
\end{itemize}

3. Check for any obvious non-Lenovo alterations. Use good judgment as to the safety of any non-Lenovo alterations.

4. Check inside the server for any obvious unsafe conditions, such as metal filings, contamination, water or other liquid, or signs of fire or smoke damage.

5. Check for worn, frayed, or pinched cables.

6. Make sure that the power-supply cover fasteners (screws or rivets) have not been removed or tampered with.
Chapter 1. Introduction

The ThinkSystem™ SR530 is a general-purpose dual-socket 1U rack server that is great for various IT workloads, include web hosting, entry cloud, and virtualization. It is ideal for small and medium-size business (SMB) customers to run many kinds of applications by offering the latest technology to support multi-core processors, faster memory speed, flexible input/output (I/O) options and tiered system management.

The server comes with a limited warranty. For details about the warranty, see: https://support.lenovo.com/us/en/solutions/ht503310

For details about your specific warranty, see: http://datacentersupport.lenovo.com/warrantylookup

Identifying your server

When you contact Lenovo for help, the machine type and serial number information helps support technicians to identify your server and provide faster service.

The machine type and serial number are on the ID label on the right rack latch in the front of the server.

Figure 1. Location of the ID label
XClarity Controller network access label

The XClarity® Controller network access label is attached on the top side of the pull-out information tab. After you get the server, peel the XClarity Controller network access label away and store it in a safe place.

![Figure 2. Location of the XClarity Controller network access label](image)

Quick response code

The system service label, which is on the top cover, provides a quick response (QR) code for mobile access to service information. Scan the QR code with a mobile device and a QR code reader application to get quick access to the Lenovo Service web site for this server. The Lenovo Service Information Web site provides additional information for parts installation and replacement videos, and error codes for server support.

The following illustration shows the QR code: [https://support.lenovo.com/p/servers/sr530](https://support.lenovo.com/p/servers/sr530)

![Figure 3. QR code](image)

Specifications

The following information is a summary of the features and specifications of the server. Depending on the model, some features might not be available, or some specifications might not apply.
### Table 1. Server specifications

<table>
<thead>
<tr>
<th>Specification</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Dimension**      | • Form factor: 1U  
• Height: 43.0 mm (1.7 inches)  
• Width:  
  – With rack latches: 482.0 mm (19.0 inches)  
  – Without rack latches: 434.4 mm (17.1 inches)  
• Depth: 778.3 mm (30.7 inches)  
**Note:** The depth is measured with rack latches and power supply installed, but without security bezel installed. |
| **Weight**         | Up to 16.0 kg (35.3 lb), depending on your configuration                                                                                     |
| **Processor**      | • Up to two Intel® Xeon® Scalable Processors  
  – Designed for Land Grid Array (LGA) 3647 socket  
  – Scalable up to 20 cores  
For a list of supported processors, see: http://www.lenovo.com/us/en/serverproven/ |
| **Memory**         | For 1st Generation Intel Xeon Scalable Processor (SP Gen 1):  
• Minimum: 8 GB  
• Maximum:  
  – 384 GB using registered DIMMs (RDIMMs)  
  – 768 GB using load-reduced DIMMs (LRDIMMs)  
• Type (depending on the model):  
  – TruDDR4 2666, single-rank or dual-rank, 8 GB/16 GB/32 GB RDIMMs  
  – TruDDR4 2666, quad-rank, 64 GB LRDIMMs  
• Slots: 12 slots  
For 2nd Generation Intel Xeon Scalable Processor (SP Gen 2):  
• Minimum: 8 GB  
• Maximum: 768 GB  
• Type (depending on the model):  
  – TruDDR4 2666, single-rank or dual-rank, 16 GB/32 GB RDIMMs  
  – TruDDR4 2933, single-rank or dual-rank, 8 GB/16 GB/32 GB/64 GB RDIMMs  
• Slots: 12 slots  
**Note:** Operating speed and total memory capacity depend on the processor model and UEFI settings.  
For a list of supported memory, see: http://www.lenovo.com/us/en/serverproven/ |

<td></td>
<td>• A RAID super capacitor module must be installed if the RAID 930-8i or 930-16i SAS/SATA adapter, RAID 930-8e SAS/SATA adapter, or RAID 730-8i 2G Flash SAS/SATA adapter is installed.</td>
</tr>
</tbody>
</table>

Table 1. Server specifications (continued)
Table 1. Server specifications (continued)

<table>
<thead>
<tr>
<th>Specification</th>
<th>Description</th>
</tr>
</thead>
</table>
| System fans            | • One processor: four system fans  
                         • Two processors: six system fans  
                         **Note:** If your server is installed with one processor, four system fans (fan 1 to fan 4) are adequate to provide proper cooling. However, you must keep the locations for fan 5 and fan 6 occupied by fan fillers to ensure proper airflow. |
| Power supplies         | Up to two hot-swap power supplies for redundancy support.  
                         • 550-watt ac 80 PLUS Platinum  
                         • 750-watt ac 80 PLUS Platinum  
                         • 750-watt ac 80 PLUS Titanium |
| Acoustical noise emissions | • Sound power levels, idle  
                             – 4.5 bels, minimum  
                             – 4.6 bels, typical  
                             – 5.2 bels, maximum  
                             • Sound power levels, operating  
                             – 5.0 bels, minimum  
                             – 5.1 bels, typical  
                             – 5.5 bels, maximum  
                         **Notes:**  
                         • These sound power levels are measured in controlled acoustical environments according to procedures specified by ISO 7779 and are reported in accordance with ISO 9296.  
                         • The declared acoustic noise levels are based on specified configurations, which may change slightly depending on configuration/conditions. |
| Electrical input       | • Sine-wave input (50–60 Hz) required  
                         • Input voltage low range  
                             – Minimum: 100 V ac  
                             – Maximum: 127 V ac  
                         • Input voltage high range:  
                             – Minimum: 200 V ac  
                             – Maximum: 240 V ac  
                         **Note:** For server models with 750-watt ac 80 PLUS Titanium power supplies, the 100–127 V ac input voltage is not supported.  
                         **CAUTION:**  
                         • 240 V dc input (input range: 180-300 V dc) is supported in Chinese Mainland ONLY. Power supply with 240 V dc input cannot support hot plugging power cord function. Before removing the power supply with dc input, please turn off server or disconnect dc power sources at the breaker panel or by turning off the power source. Then, remove the power cord.  
                         • In order for the ThinkSystem products to operate error free in both a DC or AC electrical environment, a TN-S earthing system which complies to 60364-1 IEC 2005 standard has to be present or installed. |
### Table 1. Server specifications (continued)

<table>
<thead>
<tr>
<th>Specification</th>
<th>Description</th>
</tr>
</thead>
</table>
| Minimal configuration for debugging        | • One processor in processor socket 1  
• One DIMM in slot 3   
• One power supply  
• One HDD or M.2 (if OS installation is needed for debugging)  
• Four system fans (fan 1 to fan 4)          |
| Environment                                | The server is supported in the following environment:  
• Air temperature:  
  - Operating:  
    - ASHRAE class A2: 10–35°C (50–95°F); when the altitude exceeds 900 m (2953 ft), the maximum ambient temperature value decreases by 1°C (1.8°F) with every 300 m (984 ft) of altitude increase.  
    - ASHRAE class A3: 5–40°C (41–104°F); when the altitude exceeds 900 m (2953 ft), the maximum ambient temperature value decreases by 1°C (1.8°F) with every 175 m (574 ft) of altitude increase.  
    - ASHRAE class A4: 5–45°C (41–113°F); when the altitude exceeds 900 m (2953 ft), the maximum ambient temperature value decreases by 1°C (1.8°F) with every 125 m (410 ft) of altitude increase.  
  - Server off: 5–45°C (41–113°F)  
  - Shipping or storage: -40–60°C (-40–140°F)  
• Maximum altitude: 3050 m (10 000 ft)  
• Relative humidity (non-condensing):  
  - Operating:  
    - ASHRAE class A2: 8%–80%; maximum dew point: 21°C (70°F)  
    - ASHRAE class A3: 8%–85%; maximum dew point: 24°C (75°F)  
    - ASHRAE class A4: 8%–90%; maximum dew point: 24°C (75°F)  
  - Shipping or storage: 8%–90%  
• Particulate contamination  
  **Attention:** Airborne particulates and reactive gases acting alone or in combination with other environmental factors such as humidity or temperature might pose a risk to the server. For information about the limits for particulates and gases, see “Particulate contamination” on page 168.  
  **Notes:** Your server complies with ASHRAE class A2 specifications. The server performance might be impacted when the operating temperature is outside the ASHRAE A2 specifications. Depending on the hardware configuration, some server models comply with ASHRAE class A3 and class A4 specifications. To comply with ASHRAE class A3 and class A4 specifications, the server models must meet the following hardware configuration requirements at the same time:  
  - Two power supplies must be installed.  
  - No system fan fails. |

### Important information about EU ecodesign requirements

To meet the EU ecodesign requirements for energy-related products (ErP) Lot 9, your server must meet the following requirements:
• Minimum memory: 16 GB
• For server configured with one processor, these processors are not supported: Intel Xeon 3104, 3106, 3204, 4108, 4109T, 4110, 4112, 5122, 5222, 8156, and 8256.

Firmware updates
Several options are available to update the firmware for the server.

You can use the tools listed here to update the most current firmware for your server and the devices that are installed in the server.

**Note:** Lenovo typically releases firmware in bundles called UpdateXpress System Packs (UXSPs). To ensure that all of the firmware updates are compatible, you should update all firmware at the same time. If you are updating firmware for both the Lenovo XClarity Controller and UEFI, update the firmware for Lenovo XClarity Controller first.

Best practices related to updating firmware is available at the following location:

http://lenovopress.com/LP0656

**Important terminology**

• **In-band update.** The installation or update is performed using a tool or application within an operating system that is executing on the server’s core CPU.

• **Out-of-band update.** The installation or update is performed by the Lenovo XClarity Controller collecting the update and then directing the update to the target subsystem or device. Out-of-band updates have no dependency on an operating system executing on the core CPU. However, most out-of-band operations do require the server to be in the S0 (Working) power state.

• **On-Target update.** The installation or update is initiated from an Operating System executing on the server’s operating system.

• **Off-Target update.** The installation or update is initiated from a computing device interacting directly with the server’s Lenovo XClarity Controller.

• **UpdateXpress System Packs (UXSPs).** UXSPs are bundled updates designed and tested to provide the interdependent level of functionality, performance, and compatibility. UXSPs are server machine-type specific and are built (with firmware and device driver updates) to support specific Windows Server, Red Hat Enterprise Linux (RHEL) and SUSE Linux Enterprise Server (SLES) operating system distributions. Machine-type-specific firmware-only UXSPs are also available.

See the following table to determine the best Lenovo tool to use for installing and setting up the firmware:

**Note:** The server UEFI settings for option ROM must be set to **Auto** or **UEFI** to update firmware using Lenovo XClarity Administrator or Lenovo XClarity Essentials. For more information, see the following Tech Tip:

The latest firmware can be found at the following site:

- Lenovo XClarity Provisioning Manager

  From Lenovo XClarity Provisioning Manager, you can update the Lenovo XClarity Controller firmware, the UEFI firmware, and the Lenovo XClarity Provisioning Manager software.
**Note:** By default, the Lenovo XClarity Provisioning Manager Graphical User Interface is displayed when you press F1. If you have changed that default to be the text-based system setup, you can bring up the Graphical User Interface from the text-based system setup interface.

Additional information about using Lenovo XClarity Provisioning Manager to update firmware is available at:

http://sysmgt.lenovofiles.com/help/topic/LXPM/platform_update.html

- **Lenovo XClarity Controller**
  
  If you need to install a specific update, you can use the Lenovo XClarity Controller interface for a specific server.

  **Notes:**
  
  – To perform an in-band update through Windows or Linux, the operating system driver must be installed and the Ethernet-over-USB (sometimes called LAN over USB) interface must be enabled.

  Additional information about configuring Ethernet over USB is available at:

  http://sysmgt.lenovofiles.com/help/topic/com.lenovo.systems.management.xcc.doc/NN1ia_c_configuringUSB.html

  – If you update firmware through the Lenovo XClarity Controller, make sure that you have downloaded and installed the latest device drivers for the operating system that is running on the server.

  Specific details about updating firmware using Lenovo XClarity Controller are available at:

- **Lenovo XClarity Essentials OneCLI**

  Lenovo XClarity Essentials OneCLI is a collection of command line applications that can be used to manage Lenovo servers. Its update application can be used to update firmware and device drivers for your servers. The update can be performed within the host operating system of the server (in-band) or remotely through the BMC of the server (out-of-band).

  Specific details about updating firmware using Lenovo XClarity Essentials OneCLI is available at:

- **Lenovo XClarity Essentials UpdateXpress**

  Lenovo XClarity Essentials UpdateXpress provides most of OneCLI update functions through a graphical user interface (GUI). It can be used to acquire and deploy UpdateXpress System Pack (UXSP) update packages and individual updates. UpdateXpress System Packs contain firmware and device driver updates for Microsoft Windows and for Linux.

  You can obtain Lenovo XClarity Essentials UpdateXpress from the following location:

  https://datacentersupport.lenovo.com/solutions/lnvo-xpress

- **Lenovo XClarity Essentials Bootable Media Creator**

  You can use Lenovo XClarity Essentials Bootable Media Creator to create bootable media that is suitable for applying firmware updates, running preboot diagnostics, and deploying Microsoft Windows operating systems.

  You can obtain Lenovo XClarity Essentials BoMC from the following location:

  https://datacentersupport.lenovo.com/solutions/lnvo-bomc

- **Lenovo XClarity Administrator**
If you are managing multiple servers using the Lenovo XClarity Administrator, you can update firmware for all managed servers through that interface. Firmware management is simplified by assigning firmware-compliance policies to managed endpoints. When you create and assign a compliance policy to managed endpoints, Lenovo XClarity Administrator monitors changes to the inventory for those endpoints and flags any endpoints that are out of compliance.

Specific details about updating firmware using Lenovo XClarity Administrator are available at:

Configuring the LAN over USB interface manually

To perform a firmware update through the operating system using Lenovo XClarity Essentials OneCLI, the Lenovo XClarity Controller must be configured to use the LAN over USB interface. The firmware update package attempts to perform the setup automatically, if needed. If the automatic setup fails or if you prefer to set up the LAN over USB manually, use one of the following procedures.

Additional information about using the Lenovo XClarity Controller to enable LAN over USB is available at:

http://sysmgmt.lenovofiles.com/help/topic/com.lenovo.systems.management.xcc.doc/NN1ia_c_configuringUSB.html

Installing the LAN over USB Windows device driver

When you install a Windows operating system, there might be an unknown RNDIS device in the Device Manager. Lenovo provides a Windows INF file that identifies this device.

Complete the following steps to install ibm_rndis_server_os.inf:

**Note:** You only have to perform these steps if the compute node is running a Windows operating system and the ibm_rndis_server_os.inf file has not been previously installed. The file only has to be installed once. It is required by Windows operating systems to detect and use the LAN over USB functionality.

**Step 1.** Click **Administrative Tools ➔ Computer Management ➔ Device Manager** and find the RNDIS Device. Click **Properties ➔ Driver ➔ Reinstall driver.** Point the server to the \Windows\inf directory where it can find the ibm_rndis_server_os.inf file and install the device.

**Step 2.** Click **Administrative Tools ➔ Device Manager.** Right-click **Network adapters** and select **Scan for hardware changes.** A small pop-up confirms that the Ethernet device is found and installed. The New Hardware Wizard starts automatically.

**Step 3.** When you are prompted Can Windows connect to Windows Update to search for software?, select **No, not this time.** Click **Next** to continue.

**Step 4.** When you are prompted What do you want the wizard to do?, select **Install from a list or specific location (Advanced).** Click **Next** to continue.

**Step 5.** When you are prompted Please choose your search and installation options, select **Don't search. I will choose the driver to install.** Click **Next** to continue.

**Step 6.** When you are prompted Select a hardware type, and then click **Next**, select **Network adapters.** Click **Next** to continue.

**Step 7.** When you are prompted with the statement Completing the Found New Hardware Wizard, click **Finish.** A new local area connection appears. If the message This connection has limited or no connectivity is displayed, ignore this message.

**Step 8.** Return to the Device Manager. **Lenovo USB Remote NDIS Network Device** appears under **Network Adapters.**

**Step 9.** Use the Lenovo XClarity Controller interface to view or set the IP address for the LAN adapter.
Additional information about using the Lenovo XClarity Controller to configure LAN over USB is available at:

http://sysmg.lenovofiles.com/help/topic/com.lenovo.systems.management.xcc.doc/NN1ia_c_configuringUSB.html

**Tech Tips**

Lenovo continually updates the support Web site with the latest tips and techniques that you can use to solve issues that you might have with your server. These Tech Tips (also called retain tips or service bulletins) provide procedures to work around issues related to the operation of your server.

To find the Tech Tips available for your server:
1. Go to [http://datacentersupport.lenovo.com](http://datacentersupport.lenovo.com) and navigate to the support page for your server.
2. Click **Documentation** from the navigation pane.
   
   Follow the on-screen instructions to choose the category for the problem that you are having.

**Security advisories**

Lenovo is committed to developing products and services that adhere to the highest security standards in order to protect our customers and their data. When potential vulnerabilities are reported, it is the responsibility of the Lenovo Product Security Incident Response Team (PSIRT) to investigate and provide information to our customers so they may put mitigation plans in place as we work toward providing solutions.

The list of current advisories is available at the following location:

**Power on the server**

After the server performs a short self-test (power status LED flashes quickly) when connected to input power, it enters a standby state (power status LED flashes once per second).

The server can be turned on (power status LED on) in any of the following ways:
- You can press the power button.
- The server can restart automatically after a power interruption.
- The server can respond to remote power-on requests sent to the Lenovo XClarity Controller.

For information about powering off the server, see “Power off the server” on page 11.

**Power off the server**

The server remains in a standby state when it is connected to a power source, allowing the Lenovo XClarity Controller to respond to remote power-on requests. To remove all power from the server (power status LED off), you must disconnect all power cables.

To place the server in a standby state (power status LED flashes once per second):

**Note:** The Lenovo XClarity Controller can place the server in a standby state as an automatic response to a critical system failure.

- Start an orderly shutdown using the operating system (if supported by your operating system).
- Press the power button to start an orderly shutdown (if supported by your operating system).
• Press and hold the power button for more than 4 seconds to force a shutdown.

When in a standby state, the server can respond to remote power-on requests sent to the Lenovo XClarity Controller. For information about powering on the server, see “Power on the server” on page 11.
Chapter 2. Server components

Use the information in this section to learn about each of the components associated with your server.

Front view

The front view of the server varies by the model.

- Front view of server models with 3.5-inch drive bays
- Front view of server models with 2.5-inch drive bays

The following illustrations show the front views of server models with hot-swap drives. Depending on the model, your server might look slightly different the illustrations.

![Figure 4. Front view of server models with 3.5-inch drive bays](image)

![Figure 5. Front view of server models with 2.5-inch drive bays](image)

13
Used to attach a high-performance monitor, a direct-drive monitor, or other devices that use a VGA connector.

2 Pull-out information tab

The Lenovo XClarity Controller network access label is attached on the pull-out information tab.

3 XClarity Controller USB connector

Depending on the setting, this connector supports USB 2.0 function, XClarity Controller management function, or both.

- If the connector is set for USB 2.0 function, you can attach a device that requires a USB 2.0 connection, such as a keyboard, a mouse, or a USB storage device.
- If the connector is set for XClarity Controller management function, you can attach a mobile device installed with the application to run XClarity Controller event logs.
- If the connector is set to have both functions, you can press the ID button for three seconds to switch between the two functions.

4 USB 3.0 connector

Attach a USB-compatible device, such as a USB keyboard, USB mouse, or USB storage device.

5 Operator information panel

For information about the controls and status LEDs on the operator information panel, see “Operator information panel” on page 15.

6 Rack latches

If your server is installed in a rack, you can use the rack latches to help you slide the server out of the rack. You also can use the latches and screws to secure the server in the rack so that the server cannot slide out, especially in vibration-prone areas. For more information, refer to the Rack Installation Guide that comes with your rail kit.

7 Drive bays

The number of the installed drives in your server varies by model. When you install drives, follow the order of the drive bay numbers.

The EMI integrity and cooling of the server are protected by having all drive bays occupied. The vacant drive bays must be occupied by drive fillers.

8 Drive status LED

9 Drive activity LED
Each hot-swap drive has two LEDs.

<table>
<thead>
<tr>
<th>Drive LED</th>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drive status LED (right)</td>
<td>Solid yellow</td>
<td>The drive has an error.</td>
</tr>
<tr>
<td></td>
<td>Blinking yellow (blinking slowly, about one flash per second)</td>
<td>The drive is being rebuilt.</td>
</tr>
<tr>
<td></td>
<td>Blinking yellow (blinking rapidly, about four flashes per second)</td>
<td>The RAID controller is locating the drive.</td>

</tr>
</tbody>
</table>

**Power button with power status**

You can press the power button to power on the server when you finish setting up the server. You also can hold the power button for several seconds to power off the server if you cannot shut down the server from the operating system. The power status helps you to determine the current power status.

<table>

<td>None</td>
<td>The server is disconnected from the network.</td>
</tr>
</tbody>
</table>

3 System ID button with ID LED

Use this system ID button and the blue system ID LED to visually locate the server. A system ID LED is also located on the rear of the server. Each time you press the system ID button, the state of both the system ID LEDs changes. The LEDs can be changed to on, blinking, or off. You can also use the Lenovo XClarity Controller or a remote management program to change the state of the system ID LEDs to assist in visually locating the server among other servers.

If the XClarity Controller USB connector is set to have both the USB 2.0 function and XClarity Controller management function, you can press the ID button for three seconds to switch between the two functions.

4 System error LED

<table>
<thead>
<tr>
<th>Status</th>
<th>Color</th>
<th>Description</th>
<th>Action</th>
</tr>
</thead>
</table>
| On     | Yellow | An error has been detected on the server. Causes might include but not limited to the following errors: 
• The temperature of the server reached the non-critical temperature threshold. 
• The voltage of the server reached the non-critical voltage threshold. 
• A fan has been detected to be running at low speed. 
• A fan has been removed. 
• The power supply has a critical error. 
• The power supply is not connected to the power. | Check the event log to determine the exact cause of the error. 
For information about troubleshooting, see “Troubleshooting by symptom” on page 148 . |
| Off    | None   | The server is off or the server is on and is working correctly.             | None.                                                                 |
Rear view

The rear of the server provides access to several components, including the power supplies, PCIe adapters, serial port, and Ethernet connectors.

- “Rear view of server models with three PCIe slots” on page 17
- “Rear view of server models with two PCIe slots” on page 19

Rear view of server models with three PCIe slots

The following illustration shows the rear view of server models with three PCIe slots. Depending on the model, your server might look slightly different from the illustrations in this topic.

PCIe slots on riser 1 assembly

Your server supports two types of riser cards for riser 1 assembly.

- Type 1
  - Slot 1: PCIe x16 (x8, x4, x1), low-profile
  - Slot 2: PCIe x16 (x16, x8, x4, x1), low-profile
- Type 2
  - Slot 1: PCIe x16 (x8, x4, x1), low-profile
  - Slot 2: ML2 x8 (x8, x4, x1), low-profile

PCIe slot on riser 2 assembly

Your server supports two types of riser cards for riser 2 assembly.

- Type 1: PCIe x16 (x8, x4, x1), low-profile
• Type 2: PCIe x16 (x16, x8, x4, x1), low-profile

  **Note:** Type 2 is supported only when two processors are installed.

**4 Power supply 1**

**5 Power supply 2 (available on some models)**

The hot-swap redundant power supplies help you avoid significant interruption to the operation of the system when a power supply fails. You can purchase a power supply option from Lenovo and install the power supply to provide power redundancy without turning off the server.

On each power supply, there are three status LEDs near the power cord connector. For information about the LEDs, see “Rear view LEDs” on page 21.

**6 NMI button**

Press this button to force a nonmaskable interrupt (NMI) to the processor. By this way, you can blue screen the server and take a memory dump. You might have to use a pen or the end of a straightened paper clip to press the button.

**7 USB 3.0 connectors (2)**

Attach a USB-compatible device, such as a USB keyboard, USB mouse, or USB storage device.

**8 VGA connector**

Used to attach a high-performance monitor, a direct-drive monitor, or other devices that use a VGA connector.

**9 Ethernet connector 2**

**10 Ethernet connector 1**

Used to attach an Ethernet cable for a LAN. Each Ethernet connector has two status LEDs to help you identify the Ethernet connectivity and activity. For information about the LEDs, see “Rear view LEDs” on page 21.

Ethernet connector 1 can be set as XClarity Controller network connector. To set Ethernet connector 1 as XClarity Controller network connector, start Setup utility, go to **BMC Settings ➔ Network Settings ➔ Network Interface Port** and select **Shared**. Then, go to **Shared NIC on** and select **Onboard Port 1**.

**11 XClarity Controller network connector**

Used to attach an Ethernet cable to manage the system using XClarity Controller.

**12 Ethernet connector 2 on the LOM adapter**

**13 Ethernet connector 1 on the LOM adapter**

The LOM adapter provides two extra Ethernet connectors for network connections.

Ethernet connector 1 on the LOM adapter can be set as XClarity Controller network connector. To set the Ethernet connector as XClarity Controller network connector, start Setup utility, go to **BMC Settings ➔ Network Settings ➔ Network Interface Port** and select **Shared**. Then, go to **Shared NIC on** and select **PHY Card**.
Rear view of server models with two PCIe slots

The following illustrations show the rear view of the server models with two PCIe slots. Depending on the model, your server might look slightly different from the illustrations in this topic.

**1 2 PCIe slots on riser 1 assembly**

Your server supports two types of riser cards for riser 1 assembly.

- **Type 1**
  - Slot 1: PCIe x16 (x8, x4, x1), low-profile
  - Slot 2: PCIe x16 (x16, x8, x4, x1), full-height, half-length

- **Type 2**
  - Slot 1: PCIe x16 (x8, x4, x1), low-profile
  - Slot 2: ML2 x8 (x8, x4, x1), low-profile adapter with full-height bracket

**4 Power supply 1**

**4 Power supply 2 (available on some models)**

The hot-swap redundant power supplies help you avoid significant interruption to the operation of the system when a power supply fails. You can purchase a power supply option from Lenovo and install the power supply to provide power redundancy without turning off the server.

On each power supply, there are three status LEDs near the power cord connector. For information about the LEDs, see “Rear view LEDs” on page 21.

**5 NMI button**

Press this button to force a nonmaskable interrupt (NMI) to the processor. By this way, you can blue screen the server and take a memory dump. You might have to use a pen or the end of a straightened paper clip to press the button.
**USB 3.0 connectors (2)**

Attach a USB-compatible device, such as a USB keyboard, USB mouse, or USB storage device.

**VGA connector**

Used to attach a high-performance monitor, a direct-drive monitor, or other devices that use a VGA connector.

**Ethernet connector 2**

**Ethernet connector 1**

Used to attach an Ethernet cable for a LAN. Each Ethernet connector has two status LEDs to help you identify the Ethernet connectivity and activity. For information about the LEDs, see “Rear view LEDs” on page 21.

Ethernet connector 1 can be set as XClarity Controller Network connector. To set Ethernet connector 1 as XClarity Controller Network connector, start Setup utility, go to **BMC Settings ➔ Network Settings ➔ Network Interface Port** and select **Shared**. Then, go to **Shared NIC on** and select **Onboard Port 1**.

**XClarity Controller network connector**

Used to attach an Ethernet cable to manage the system using XClarity Controller.

**Ethernet connector 2 on the LOM adapter**

**Ethernet connector 1 on the LOM adapter**

The LOM adapter provides two extra Ethernet connectors for network connections.

Ethernet connector 1 on the LOM adapter can be set as XClarity Controller Network connector. To set the Ethernet connector as XClarity Controller Network connector, start Setup utility, go to **BMC Settings ➔ Network Settings ➔ Network Interface Port** and select **Shared**. Then, go to **Shared NIC on** and select **PHY Card**.
## Rear view LEDs

The rear of the server provides system ID LED, system error LED, network LEDs, and power supply LEDs.

The following illustration shows the LEDs on the rear view of server models with three PCIe slots. The LEDs on the rear view of server models with two PCIe slots are the same.

![Rear view LEDs](image)

**Important:**

- Before you move the switches and jumpers, turn off the server. Then, disconnect all power cords and external cables. Do not open your server or attempt any repair before reading and understanding the following information:
  - “Handling static-sensitive devices” on page 43
- Any system-board switch or jumper block that is not shown in the illustrations in this document are reserved.

Internal cable routing

Some of the components in the server have internal cables and cable connectors.

To connect cables, observe the following guidelines:

- Power off the server before you connect or disconnect any internal cables.
- See the documentation that comes with any external devices for additional cabling instructions. It might be easier for you to route cables before you connect the devices to the server.
- Cable identifiers of some cables are printed on the cables that come with the server and optional devices. Use these identifiers to connect the cables to the correct connectors.
- Ensure that the relevant cables pass through the cable clips.

**Note:** Disengage all latches, release tabs, or locks on cable connectors when you disconnect cables from the system board. Failing to release them before removing the cables will damage the cable sockets on the system board, which are fragile. Any damage to the cable sockets might require replacing the system board.
**VGA connector**

Use this section to understand the cable routing for the video graphic adapter (VGA) connector.

**Note:** The VGA connector is available on some models.

**Server models with 3.5-inch drive bays**

Parts list

Use the parts list to identify each of the components that are available for your server.

For more information about ordering the parts shown in Figure 20 “Server components” on page 36, go to:

Note: Depending on the model, your server might look slightly different from the following illustration. Some of the components might not be available on your server.

Figure 20. Server components

The parts listed in the following table are identified as one of the following:
• Tier 1 customer replaceable unit (CRU): Replacement of Tier 1 CRUs is your responsibility. If Lenovo installs a Tier 1 CRU at your request with no service agreement, you will be charged for the installation.
• Tier 2 customer replaceable unit: You may install a Tier 2 CRU yourself or request Lenovo to install it, at no additional charge, under the type of warranty service that is designated for your server.
• Field replaceable unit (FRU): FRUs must be installed only by trained service technicians.
• Consumable and Structural parts: Purchase and replacement of consumable and structural parts (components, such as a cover or bezel) is your responsibility. If Lenovo acquires or installs a structural component at your request, you will be charged for the service.

**Power cords**

Several power cords are available, depending on the country and region where the server is installed.

To view the power cords that are available for the server:

1. Go to: http://dcsc.lenovo.com/#
2. Click **Preconfigured Model** or **Configure to order**.
3. Enter the machine type and model for your server to display the configurator page.
4. Click **Power ➞ Power Cables** to see all line cords.

**Notes:**

- For your safety, a power cord with a grounded attachment plug is provided to use with this product. To avoid electrical shock, always use the power cord and plug with a properly grounded outlet.
- Power cords for this product that are used in the United States and Canada are listed by Underwriter’s Laboratories (UL) and certified by the Canadian Standards Association (CSA).
- For units intended to be operated at 115 volts: Use a UL-listed and CSA-certified cord set consisting of a minimum 18 AWG, Type SVT or SJT, three-conductor cord, a maximum of 15 feet in length and a parallel blade, grounding-type attachment plug rated 15 amperes, 125 volts.
- For units intended to be operated at 230 volts (U.S. use): Use a UL-listed and CSA-certified cord set consisting of a minimum 18 AWG, Type SVT or SJT, three-conductor cord, a maximum of 15 feet in length and a tandem blade, grounding-type attachment plug rated 15 amperes, 250 volts.
- For units intended to be operated at 230 volts (outside the U.S.): Use a cord set with a grounding-type attachment plug. The cord set should have the appropriate safety approvals for the country in which the equipment will be installed.
- Power cords for a specific country or region are usually available only in that country or region.
Chapter 3. Hardware replacement procedures

This section provides installation and removal procedures for all serviceable system components. Each component replacement procedure references any tasks that need to be performed to gain access to the component being replaced.

For more information about ordering parts, go to:

Note: If you replace a part, such as an adapter, that contains firmware, you might also need to update the firmware for that part. For more information about updating firmware, see “Firmware updates” on page 7.

Installation Guidelines

Before installing components in your server, read the installation guidelines.

Before installing optional devices, read the following notices carefully:

Attention: Prevent exposure to static electricity, which might lead to system halt and loss of data, by keeping static-sensitive components in their static-protective packages until installation, and handling these devices with an electrostatic-discharge wrist strap or other grounding system.

• Read the safety information and guidelines to ensure that you work safely.
  – “Handling static-sensitive devices” on page 43
  – “Working inside the server with the power on” on page 43
• Make sure the components you are installing are supported by the server. For a list of supported optional components for the server, see http://www.lenovo.com/us/en/serverproven/.
• When you install a new server, download and apply the latest firmware. This will help ensure that any known issues are addressed, and that your server is ready to work with optimal performance. Go to ThinkSystem SR530 Drivers and Software to download firmware updates for your server.

  Important: Some cluster solutions require specific code levels or coordinated code updates. If the component is part of a cluster solution, verify that the latest level of code is supported for the cluster solution before you update the code.

• It is good practice to make sure that the server is working correctly before you install an optional component.
• Keep the working area clean, and place removed components on a flat and smooth surface that does not shake or tilt.
• Do not attempt to lift an object that might be too heavy for you. If you have to lift a heavy object, read the following precautions carefully:
  – Make sure that you can stand steadily without slipping.
  – Distribute the weight of the object equally between your feet.
  – Use a slow lifting force. Never move suddenly or twist when you lift a heavy object.
  – To avoid straining the muscles in your back, lift by standing or by pushing up with your leg muscles.
• Make sure that you have an adequate number of properly grounded electrical outlets for the server, monitor, and other devices.
• Back up all important data before you make changes related to the disk drives.

• Have a small flat-blade screwdriver, a small Phillips screwdriver, and a T8 torx screwdriver available.

• To view the error LEDs on the system board and internal components, leave the power on.

• You do not have to turn off the server to remove or install hot-swap power supplies, hot-swap fans, or hot-plug USB devices. However, you must turn off the server before you perform any steps that involve removing or installing adapter cables, and you must disconnect the power source from the server before you perform any steps that involve removing or installing a riser card.

• Blue on a component indicates touch points, where you can grip to remove a component from or install it in the server, open or close a latch, and so on.

• Orange on a component or an orange label on or near a component indicates that the component can be hot-swapped if the server and operating system support hot-swap capability, which means that you can remove or install the component while the server is still running. (Orange can also indicate touch points on hot-swap components.) See the instructions for removing or installing a specific hot-swap component for any additional procedures that you might have to perform before you remove or install the component.

• The Red strip on the drives, adjacent to the release latch, indicates that the drive can be hot-swapped if the server and operating system support hot-swap capability. This means that you can remove or install the drive while the server is still running.

  **Note:** See the system specific instructions for removing or installing a hot-swap drive for any additional procedures that you might need to perform before you remove or install the drive.

• After finishing working on the server, make sure you reinstall all safety shields, guards, labels, and ground wires.

**System reliability guidelines**

Review the system reliability guidelines to ensure proper system cooling and reliability.

Make sure the following requirements are met:

• When the server comes with redundant power, a power supply must be installed in each power-supply bay.

• Adequate space around the server must be spared to allow server cooling system to work properly. Leave approximately 50 mm (2.0 in.) of open space around the front and rear of the server. Do not place any object in front of the fans.

• For proper cooling and airflow, refit the server cover before you turn the power on. Do not operate the server for more than 30 minutes with the server cover removed, for it might damage server components.

• Cabling instructions that come with optional components must be followed.

• A failed fan must be replaced within 48 hours since malfunction.

• A removed hot-swap fan must be replaced within 30 seconds after removal.

• A removed hot-swap drive must be replaced within two minutes after removal.

• A removed hot-swap power supply must be replaced within two minutes after removal.

• Every air baffle that comes with the server must be installed when the server starts (some servers might come with more than one air baffle). Operating the server with a missing air baffle might damage the processor.

• All processor sockets must contain either a socket cover or a processor with heat sink.

• When more than one processor is installed, fan population rules for each server must be strictly followed.
Working inside the server with the power on

You might need to keep the power on with the server cover removed to look at system information on the display panel or to replace hot-swap components. Review these guidelines before doing so.

Attention: The server might stop and loss of data might occur when internal server components are exposed to static electricity. To avoid this potential problem, always use an electrostatic-discharge wrist strap or other grounding systems when working inside the server with the power on.

- Avoid loose-fitting clothing, particularly around your forearms. Button or roll up long sleeves before working inside the server.
- Prevent your necktie, scarf, badge rope, or long hair from dangling into the server.
- Remove jewelry, such as bracelets, necklaces, rings, cuff links, and wrist watches.
- Remove items from your shirt pocket, such as pens and pencils, in case they fall into the server as you lean over it.
- Avoid dropping any metallic objects, such as paper clips, hairpins, and screws, into the server.

Handling static-sensitive devices

Review these guidelines before you handle static-sensitive devices to reduce the possibility of damage from electrostatic discharge.

Attention: Prevent exposure to static electricity, which might lead to system halt and loss of data, by keeping static-sensitive components in their static-protective packages until installation, and handling these devices with an electrostatic-discharge wrist strap or other grounding system.

- Limit your movement to prevent building up static electricity around you.
- Take additional care when handling devices during cold weather, for heating would reduce indoor humidity and increase static electricity.
- Always use an electrostatic-discharge wrist strap or other grounding system, particularly when working inside the server with the power on.
- While the device is still in its static-protective package, touch it to an unpainted metal surface on the outside of the server for at least two seconds. This drains static electricity from the package and from your body.
- Remove the device from the package and install it directly into the server without putting it down. If it is necessary to put the device down, put it back into the static-protective package. Never place the device on the server or on any metal surface.
- When handling a device, carefully hold it by the edges or the frame.
- Do not touch solder joints, pins, or exposed circuitry.
- Keep the device from others’ reach to prevent possible damages.
Rack latches replacement
Use this information to remove and install the rack latches.

Remove the rack latches
Use this information to remove the rack latches.

“Read the installation Guidelines” on page 41

Before removing the rack latches:

1. If you have installed the security bezel, remove it. See “Remove the security bezel” on page 48.
2. Use a flat-blade screwdriver to remove the ID label plate on the right rack latch and place it in a safe place.

Figure 21. ID label plate removal

To remove the rack latches, complete the following steps:

Watch the procedure. A video of the removal process is available:

- Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDKW6L3KtHW6maY_O
- Youku: http://list.youku.com/albumlist/show/id_50437162
Step 1. On each side of the server, remove the two screws that secure the rack latch.

Figure 22. Rack latch screws removal

Step 2. On each side of the server, remove the rack latch from the chassis as shown.

Figure 23. Rack latch removal

If you are instructed to return the old rack latches, follow all packaging instructions and use any packaging materials that are provided.
Install the rack latches

Use this information to install the rack latches.

“Read the installation Guidelines” on page 41

To install the rack latches, complete the following steps:

Watch the procedure. A video of the installation process is available:
- Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O
- Youku: http://list.youku.com/albumlist/show/id_50437162

Step 1. On each side of the server, align the rack latch with the pin on the chassis; then, press the rack latch onto the chassis and slightly slide it forward as shown.

Figure 24. Rack latch installation
Step 2. Install the two screws to secure the rack latch on each side of the server.

Figure 25. Rack latch screws installation

After installing the rack latches:
1. Install the ID label plate to the right rack latch as shown.

Figure 26. ID label plate installation

2. Complete the parts replacement. See “Complete the parts replacement” on page 143.
Security bezel replacement
Use this information to remove and install the security bezel.

Remove the security bezel
Use this information to remove the security bezel.

"Read the installation Guidelines" on page 41

To remove the security bezel, complete the following steps:
Step 1. Use the key to unlock the security bezel.

Figure 27. Security bezel unlock
Step 2. Press the blue release latch 1 and pivot the security bezel outward to remove it from the chassis.

Figure 28. Security bezel removal

Attention: Before you ship the rack with the server installed, reinstall and lock the security bezel into place.
Install the security bezel

Use this information to install the security bezel.

Attention: Before you ship the rack with the server installed, install and lock the security bezel into place.

Before installing the security bezel, if you have removed the rack latches, reinstall them. See “Install the rack latches” on page 46.

To install the security bezel, complete the following steps:
Step 1. If the key is held inside the security bezel, remove it out of the security bezel.

![Figure 29. Key removal](image)
Step 2. Insert the tab on the security bezel into the slot on the right side of the chassis. Then, press the blue release latch 1 and pivot the security bezel inward until it clicks into place.

Figure 30. Security bezel installation

Step 3. Use the key to lock the security bezel.

Figure 31. Security bezel lockup
Top cover replacement
Use this information to remove and install the top cover.

S033

CAUTION:
Hazardous energy present. Voltages with hazardous energy might cause heating when shorted with metal, which might result in spattered metal, burns, or both.

S014

CAUTION:
Hazardous voltage, current, and energy levels might be present. Only a qualified service technician is authorized to remove the covers where the label is attached.

Remove the top cover
Use this information to remove the top cover.

To remove the top cover, complete the following steps:

Watch the procedure. A video of the removal process is available:
- Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O
- Youku: http://list.youku.com/albumlist/show/id_50437162
Step 1. Use a screwdriver to turn the cover lock to the open position.
Step 2. Press the blue button on the cover latch and open the cover latch.
Step 3. Slide the cover to the rear until it is disengaged from the chassis. Then, lift the cover off the chassis and place it on a flat clean surface.

Attention:

- Handle the top cover carefully. Dropping the top cover with the cover latch open might damage the cover latch.
- For proper cooling and airflow, install the top cover before you power on the server.
Install the top cover

Use this information to install the top cover.

Before installing the top cover:
1. Ensure that all cables, adapters, and other components are installed and seated correctly and that you have not left loose tools or parts inside the server.
2. Ensure that all internal cables are correctly routed. See “Internal cable routing” on page 28.
3. If you are installing a new top cover, attach the service label to the new top cover first if necessary.

   **Note:** A new top cover comes without a service label attached. If you need a service label, order it together with the new top cover. The service label is free of charge.

To install the top cover, complete the following steps:

**Watch the procedure.** A video of the installation process is available:
- Youtube: [https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHw6maY_O](https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHw6maY_O)
- Youku: [http://list.youku.com/albumlist/show/id_50437162](http://list.youku.com/albumlist/show/id_50437162)

![Figure 33. Top cover installation](image)

**Note:** Before you slide the top cover forward, ensure that all the tabs on the top cover engage the chassis correctly. If the tabs do not engage the chassis correctly, it will be very difficult to remove the top cover later.

Step 1. Ensure that the cover latch is in the open position. Lower the cover onto the chassis until all tabs on both sides of the cover engage with the guides on both sides of the chassis.

Step 2. Pivot the cover latch and slide the cover forward until the cover snaps into position. Ensure that the cover latch is completely closed.

Step 3. Use a screwdriver to turn the cover lock to the closed position.
Air baffle replacement

Use this information to remove and install the air baffle.

**S033**

**CAUTION:**
Hazardous energy present. Voltages with hazardous energy might cause heating when shorted with metal, which might result in spattered metal, burns, or both.

**S017**

**CAUTION:**
Hazardous moving fan blades nearby. Keep fingers and other body parts away.

**Remove the air baffle**

Use this information to remove the air baffle.

To remove the air baffle, complete the following steps:

**Watch the procedure.** A video of the removal process is available:

- Youtube: [https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O](https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O)
- Youku: [http://list.youku.com/albumlist/show/id_50437162](http://list.youku.com/albumlist/show/id_50437162)
Figure 34. Air baffle removal

Step 1. Remove the top cover. See “Remove the top cover” on page 52.

Step 2. If the server has a RAID super capacitor module installed underneath the air baffle, disconnect its cable from the extension cable.

Step 3. Grasp the air baffle and carefully lift it out of the server.

Attention: For proper cooling and airflow, install the air baffle before you power on the server. Operating the server without an air baffle might damage server components.
Install the air baffle

Use this information to install the air baffle.

Before installing the air baffle:

1. Ensure that the retaining clips on each end of the DIMM connectors are closed.
2. If you want to install a RAID super capacitor module, install it onto the air baffle first. See “Install a RAID super capacitor module” on page 60.

To install the air baffle, complete the following steps:

Watch the procedure. A video of the installation process is available:

- Youtube: [https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O](https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O)
- Youku: [http://list.youku.com/albumlist/show/id_50437162](http://list.youku.com/albumlist/show/id_50437162)

![Figure 35. Air baffle installation](image)

Step 1. Align the tabs on both sides of the air baffle with the corresponding slots on both sides of the chassis.

Step 2. Lower the air baffle into the server and press the air baffle down until it is securely seated.

After installing the air baffle:

1. If you have installed a RAID super capacitor module, connect it to the RAID adapter using the extension cable that comes with the RAID super capacitor module. See “Internal cable routing” on page 28.
2. Complete the parts replacement. See “Complete the parts replacement” on page 143.
RAID super capacitor module replacement

Use this information to remove and install a RAID super capacitor module.

Your server supports up to two RAID super capacitor modules. The RAID super capacitor holders are located underneath the air baffle.

Remove a RAID super capacitor module

Use this information to remove a RAID super capacitor module.

**Before removing the RAID super capacitor module:**

1. Remove the top cover. See “Remove the top cover” on page 52.

2. Locate the RAID super capacitor module, and disconnect its cable. The RAID super capacitor holders are located underneath the air baffle.

3. Remove the air baffle and turn it over. See “Remove the air baffle” on page 55.

To remove the RAID super capacitor module, complete the following steps:

![Figure 36. RAID super capacitor module removal](image)

**Step 1.** Gently pivot the retaining clip as shown.

**Step 2.** Lift the RAID super capacitor up and remove it from the holder.

If you are instructed to return the old RAID super capacitor module, follow all packaging instructions and use any packaging materials that are provided.
Install a RAID super capacitor module

If your server has a RAID adapter with a super capacitor connector, you can install a RAID super capacitor module in your server.

Before installing the RAID super capacitor module:

1. Remove the top cover. See “Remove the top cover” on page 52.
2. Remove the air baffle and turn it over. See “Remove the air baffle” on page 55.
3. Locate the RAID super capacitor holder.
4. Touch the static-protective package that contains the new RAID super capacitor module to any unpainted surface on the outside of the server. Then, take the new RAID super capacitor module out of the package and place it on a static-protective surface.

To install the RAID super capacitor module, complete the following steps:

Step 1. Insert the RAID super capacitor module into the retaining clip at one side as shown.
Step 2. Press the RAID super capacitor module down on the other side until it snaps into place.
Step 3. Connect the RAID super capacitor module to the RAID adapter using an extension cable. See “Internal cable routing” on page 28.
Step 4. If your server has two RAID adapters each with a super capacitor connector, you can continue to install the second RAID super capacitor module.

After installing the RAID super capacitor module, complete the parts installation. See “Complete the parts replacement” on page 143.
System fan replacement

Use this information to remove and install a system fan.

S033

CAUTION:
Hazardous energy present. Voltages with hazardous energy might cause heating when shorted with metal, which might result in spattered metal, burns, or both.

S009

CAUTION:
To avoid personal injury, disconnect the fan cables before removing the fan from the device.

S002

CAUTION:
The power-control button on the device and the power switch on the power supply do not turn off the electrical current supplied to the device. The device also might have more than one power cord. To remove all electrical current from the device, ensure that all power cords are disconnected from the power source.

Remove a system fan

Use this information to remove a system fan.

Before removing a system fan:

1. Remove the top cover. See “Remove the top cover” on page 52.
2. Remove the air baffle. See “Remove the air baffle” on page 55.

To remove a system fan, complete the following steps:

Watch the procedure. A video of the removal process is available:
Figure 38. System fan removal

Step 1. Disconnect the system fan cable from the system board.
Step 2. Grasp the system fan with your index finger and thumb and carefully lift it straight up.

After removing the system fan:
1. Install a new fan to cover the fan bay.
2. If you are instructed to return the old system fan, follow all packaging instructions and use any packaging materials that are provided.
Install a system fan

Use this information to install a system fan.

Before installing a system fan, touch the static-protective package that contains the new system fan to any unpainted surface on the outside of the server. Then, take the new system fan out of the package and place it on a static-protective surface.

To install a system fan, complete the following steps:

Watch the procedure. A video of the installation process is available:
- Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWC6maY_O
- Youku: http://list.youku.com/albumlist/show/id_50437162

Step 1. Align the support holes of the system fan with the two pins in the chassis, and press it straight down until it is seated into place.

Note: Ensure that the system fan cable is at the side next to the system board.

Step 2. Connect the system fan cable to the system fan connector on the system board.

After installing the system fan, complete the parts replacement. See “Complete the parts replacement” on page 143.

Figure 39. System fan installation
Front I/O assembly replacement

Use this information to remove and install the front I/O assembly.

Remove the front I/O assembly

Use this information to remove the front I/O assembly.

“Read the installation Guidelines” on page 41

“Power off the server for this task” on page 11

“ATTENTION: Static Sensitive Device Ground package before opening” on page 43

Before removing the front I/O assembly:

1. Remove the top cover. See “Remove the top cover” on page 52.
2. If the security bezel is installed, remove it. See “Remove the security bezel” on page 48.
3. Disconnect cables of the front I/O assembly from the system board.

To remove the front I/O assembly, complete the following steps:

Watch the procedure. A video of the removal process is available:

- Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O
- Youku: http://list.youku.com/albumlist/show/id_50437162

Table 10. Front I/O assembly removal

Step 1. Remove the screws that secure the front I/O assembly.
Step 2. Slide the front I/O assembly out of the assembly bay.

If you are instructed to return the old front I/O assembly, follow all packaging instructions and use any packaging materials that are provided.
Install the front I/O assembly

Use this information to install the front I/O assembly.

Before installing the front I/O assembly, touch the static-protective package that contains the new front I/O assembly to any unpainted surface on the outside of the server. Then, take new the front I/O assembly out of the package and place it on a static-protective surface.

To install the front I/O assembly, complete the following steps:

Watch the procedure. A video of the installation process is available:
- Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KlHw6maY_O
- Youku: http://list.youku.com/albumlist/show/id_50437162

Table 11. Front I/O assembly installation

Step 1. Insert the front I/O assembly into the assembly bay.
Step 2. Install the screws to secure the front I/O assembly in place.
Step 3. Connect the cables of the front I/O assembly to the system board. See “Internal cable routing” on page 28.

After installing the front I/O assembly, complete the parts replacement. See “Complete the parts replacement” on page 143.
Hot-swap drive backplane replacement

Use this information to remove and install the hot-swap drive backplane.

Remove the backplane for four 3.5-inch hot-swap drives

Use this information to remove the backplane for four 3.5-inch hot-swap drives.

Before removing the backplane:
1. Remove the top cover. See “Remove the top cover” on page 52.
2. Record the cable connections on the backplane and then disconnect cables from the backplane.
3. Remove all the installed drives and drive fillers (if any) from the drive bays. See “Remove a hot-swap drive” on page 73.

To remove the backplane, complete the following steps:

Watch the procedure. A video of the removal process is available:
• Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O
• Youku: http://list.youku.com/albumlist/show/id_50437162

Figure 44. Backplane removal

Step 1. Open the release latches that secure the backplane.
Step 2. Pivot the backplane backward slightly to release it from the three pins 1 on the chassis.
Step 3. Carefully remove the backplane out of the chassis from under the front I/O assembly cables.

If you are instructed to return the old backplane, follow all packaging instructions and use any packaging materials that are provided.

Install the backplane for four 3.5-inch hot-swap drives
Use this information to install the backplane for four 3.5-inch hot-swap drives.

“Read the installation Guidelines” on page 41
“Power off the server for this task” on page 11
“ATTENTION: Static Sensitive Device Ground package before opening” on page 43

Before installing the backplane, touch the static-protective package that contains the new backplane to any unpainted surface on the outside of the server. Then, take the new backplane out of the package and place it on a static-protective surface.

To install the backplane, complete the following steps:

Watch the procedure. A video of the installation process is available:
• Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O
• Youku: http://list.youku.com/albumlist/show/id_50437162

Figure 45. Backplane installation
Step 1. Put the backplane under the front I/O assembly cables, align it with the chassis, and lower it into the chassis. Put the backplane into place with it leaning backward slightly so that the three pins on the chassis pass through the three holes in the backplane.

Step 2. Close the release latches to secure the backplane in place.

After installing the backplane:

2. Reinstall all the drives and drive fillers that you removed. See “Install a hot-swap drive” on page 74.
3. Complete the parts replacement. See “Complete the parts replacement” on page 143.

Remove the backplane for eight 2.5-inch hot-swap drives

Use this information to remove the backplane for eight 2.5-inch hot-swap drives.

Before removing the backplane:

1. Remove the top cover. See “Remove the top cover” on page 52.
2. Record the cable connections on the backplane and then disconnect cables from the backplane.
3. Remove all the installed drives and drive fillers (if any) from the drive bays. See “Remove a hot-swap drive” on page 73.

To remove the backplane, complete the following step:

Step 1. Grasp the backplane and carefully lift it out of the chassis.
If you are instructed to return the old backplane, follow all packaging instructions and use any packaging materials that are provided.

**Install the backplane for eight 2.5-inch hot-swap drives**

Use this information to install the backplane for eight 2.5-inch hot-swap drives.

| “Read the installation Guidelines” on page 41 | “Power off the server for this task” on page 11 | “ATTENTION: Static Sensitive Device Ground package before opening” on page 43 |

Before installing the backplane, touch the static-protective package that contains the new backplane to any unpainted surface on the outside of the server. Then, take the new backplane out of the package and place it on a static-protective surface.

To install the backplane, complete the following steps:

![Figure 47. Backplane installation](image)

**Step 1.** Align pins 1 on the backplane with the holes 2 in the chassis.

**Step 2.** Lower the backplane into the chassis. Ensure that the pins pass through the holes and the backplane is fully seated in place.

After installing the backplane:

2. Reinstall all the drives and drive fillers that you removed. See “Install a hot-swap drive” on page 74.
3. Complete the parts replacement. See “Complete the parts replacement” on page 143.
Simple-swap drive backplate assembly replacement

Use this information to remove and install the simple-swap drive backplate assembly.

Remove the simple-swap drive backplate assembly

Use this information to remove the simple-swap drive backplate assembly.

![Diagram of simple-swap drive backplate assembly removal](image)

**Figure 48. Simple-swap drive backplate assembly removal**

To remove the simple-swap drive backplate assembly, complete the following steps:

1. Open the release latches that secure the simple-swap drive backplate assembly.
2. Pivot the simple-swap drive backplate assembly backward slightly to release it from the three pins \[1\] on the chassis.
3. Carefully remove the backplate assembly out of the chassis from under the front I/O assembly cables.

**Before removing the simple-swap drive backplate assembly:**

1. Remove the top cover. See “Remove the top cover” on page 52.
2. Record the cable connections and disconnect cables of the simple-swap drive backplate assembly.
3. Remove all the installed drives and drive fillers (if any) from the drive bays. See “Remove a simple-swap drive” on page 76.
If you are instructed to return the old simple-swap drive backplate assembly, follow all packaging instructions and use any packaging materials that are provided.

Install the simple-swap drive backplate assembly

Use this information to install the simple-swap drive backplate assembly.

Before installing the simple-swap drive backplate assembly, touch the static-protective package that contains the new backplate assembly to any unpainted surface on the outside of the server. Then, take the new backplate assembly out of the package and place it on a static-protective surface.

To install the simple-swap drive backplate assembly, complete the following steps:

Figure 49. Simple-swap drive backplate assembly installation

Step 1. Put the backplate assembly under the front I/O assembly cables, align it with the chassis, and lower it into the chassis. Put the backplate assembly into place with it leaning backward slightly so that the three pins 1 on the chassis pass through the three holes 2 in the assembly.

Step 2. Close the release latches to secure the backplate assembly in place.
After installing the simple-swap drive backplate assembly:

1. Connect cables of the simple-swap drive backplate assembly to the system board. See “Internal cable routing” on page 28.

2. Reinstall all the drives and drive fillers that you removed. See “Install a simple-swap drive” on page 78.

3. Complete the parts replacement. See “Complete the parts replacement” on page 143.

---

**Hot-swap drive replacement**

Use this information to remove and install a hot-swap drive. You can remove or install a hot-swap drive without powering off the server, which helps you avoid significant interruption to the operation of the system.

**Notes:**

- The term “hot-swap drive” refers to all the supported types of hot-swap hard disk drives (HDDs) and hot-swap solid-state drives (SSDs).
- Use any documentation that comes with the drive and follow those instructions in addition to the instructions in this topic. Ensure that you have all the cables and other equipment that are specified in the documentation that comes with the drive.
- The electromagnetic interference (EMI) integrity and cooling of the server are protected by having all drive bays covered or occupied. The vacant bays are either covered by an EMI-protective panel or occupied by drive fillers. When installing a drive, save the removed drive filler in case that you later remove the drive and need the drive filler to cover the place.
- To avoid damage to the drive connectors, ensure that the top cover is in place and fully closed whenever you install or remove a drive.

---

**Remove a hot-swap drive**

Use this information to remove a hot-swap drive.

Before removing a hot-swap drive:

1. Ensure that you have back up data on your drive, especially if it is part of a RAID array.
   - Before you make changes to drives, drive controllers, drive backplanes, or drive cables, back up all important data that is stored on the drives.
   - Before you remove any component of a RAID array, back up all RAID configuration information.

2. Remove the security bezel. See “Remove the security bezel” on page 48.

**Attention:** To ensure that there is adequate system cooling, do not operate the server for more than two minutes without either a drive or a drive filler installed in each bay.

To remove a hot-swap drive, complete the following steps:

**Watch the procedure.** A video of the removal process is available:

- Youtube: [https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O](https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O)
- Youku: [http://list.youku.com/albumlist/show/id_50437162](http://list.youku.com/albumlist/show/id_50437162)
Step 1. Slide the release latch to the left to open the drive tray handle.

*Figure 50. Opening the drive tray handle*

Step 2. Grasp the handle and slide the drive out of the drive bay.

*Figure 51. Sliding the drive out of the drive bay*

Step 3. Install a drive filler or a new drive to cover the drive bay.

If you are instructed to return the old drive, follow all packaging instructions and use any packaging materials that are provided.

**Install a hot-swap drive**

Use this information to install a hot-swap drive.

**Notes:**

- The drive bays are numbered to indicate the installation order (starting from number “0”). Follow the installation order when you install a drive. See “Front view” on page 13.
- You can mix drives of different types and different capacities in one system, but not in one RAID array. The following order is recommended when installing the drives:
- Drive type priority: SAS SSD, SATA SSD, SAS HDD, SATA HDD
- Drive capacity priority: the lowest capacity first

- The drives in a single RAID array must be the same type, same size, and same capacity.

Before installing a hot-swap drive:
1. If there is a drive filler installed, remove it and keep it in a safe place.
2. Touch the static-protective package that contains the new drive to any unpainted surface on the outside of the server. Then, take the new drive out of the package and place it on a static-protective surface.

To install a hot-swap drive, complete the following steps:

**Watch the procedure.** A video of the installation process is available:
- Youtube: [https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O](https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O)
- Youku: [http://list.youku.com/albumlist/show/id_50437162](http://list.youku.com/albumlist/show/id_50437162)

![Figure 52. Hot-swap drive installation](image)

**Figure 52. Hot-swap drive installation**

Step 1. Ensure that the drive tray handle is in the open position. Slide the drive into the drive bay until it snaps into position.
Step 2. Close the drive tray handle to lock the drive in place.
Step 3. Check the drive status LED to verify that the drive is operating correctly.
   - If the yellow drive status LED is lit continuously, that drive is faulty and must be replaced.
   - If the green drive activity LED is flashing, the drive is being accessed.
Step 4. Continue to install additional hot-swap drives if necessary.

After installing all drives:
1. Reinstall the security bezel. See “Install the security bezel” on page 50.
2. Use the Lenovo XClarity Provisioning Manager to configure the RAID if necessary. For more information, see:
Simple-swap drive replacement

Use this information to remove and install a simple-swap drive.

Notes:

• The term “simple-swap drive” refers to all the supported types of simple-swap hard disk drives (HDDs) and simple-swap solid-state drives (SSDs).

• You must power off the server before installing or replacing a simple-swap drive.

• Use any documentation that comes with the drive and follow those instructions in addition to the instructions in this topic. Ensure that you have all the cables and other equipment that are specified in the documentation that comes with the drive.

• The electromagnetic interference (EMI) integrity and cooling of the server are protected by having all drive bays covered or occupied. The vacant bays are either covered by an EMI-protective panel or occupied by drive fillers. When installing a drive, save the removed drive filler in case that you later remove the drive and need the drive filler to cover the place.

• To avoid damage to the drive connectors, ensure that the top cover is in place and fully closed whenever you install or remove a drive.

Remove a simple-swap drive

Use this information to remove a simple-swap drive.

Before removing a simple-swap drive:

1. Ensure that you have back up data on your drive, especially if it is part of a RAID array.
   • Before you make changes to drives, drive controllers, drive backplanes, or drive cables, back up all important data that is stored on the drives.
   • Before you remove any component of a RAID array, back up all RAID configuration information.
2. Remove the security bezel. See “Remove the security bezel” on page 48.

Attention: To make sure that there is adequate system cooling, do not operate the server for more than two minutes without either a drive or a drive filler installed in each bay.

To remove a simple-swap drive, complete the following steps:
Step 1. Use a screwdriver to unlock the handle lock 1. The handle opens automatically.

![Figure 53. Opening the drive tray handle](image)

Step 2. Grasp the handle and slide the drive out of the drive bay.

![Figure 54. Sliding the drive out of the drive bay](image)

Step 3. Install a drive filler or a new drive to cover the drive bay.

If you are instructed to return the old drive, follow all packaging instructions and use any packaging materials that are provided.
Install a simple-swap drive

Use this information to install a simple-swap drive.

Notes:

- For a list of supported drives, see http://www.lenovo.com/us/en/serverproven/.
- The drive bays are numbered to indicate the installation order (starting from number “0”). Follow the installation order when you install a drive. See “Front view” on page 13.
- You can mix drives of different types and different capacities in one system, but not in one RAID array. The following order is recommended when installing the drives:
  - Drive type priority: SATA SSD, SATA HDD
  - Drive capacity priority: the lowest capacity first
- The drives in a single RAID array must be the same type, same size, and same capacity.

Before installing a simple-swap drive:

1. If there is a drive filler installed, remove it and keep it in a safe place.
2. Touch the static-protective package that contains the new drive to any unpainted surface on the outside of the server. Then, take the new drive out of the package and place it on a static-protective surface.

To install a simple-swap drive, complete the following steps:

Figure 55. Simple-swap drive installation
Step 1. Ensure that the drive tray handle is in the open position. Slide the drive into the drive bay until it snaps into position.

Step 2. Close the drive tray handle to lock the drive in place.

Step 3. Continue to install additional simple-swap drives if necessary.

After you have installed all drives:

1. Reinstall the security bezel. See “Install the security bezel” on page 50.
2. Power on the server.
3. Use the Lenovo XClarity Provisioning Manager to configure the RAID if necessary. For more information, see: http://sysmgt.lenovofiles.com/help/topic/LXPM/RAID_setup.html

Memory module replacement

Use this information to remove and install a memory module.

Remove a memory module

Use this information to remove a memory module.

Attention:

- Disconnect all power cords for this task.
- Memory modules are sensitive to static discharge and require special handling. In addition to the standard guidelines for “Handling static-sensitive devices” on page 43:
  - Always wear an electrostatic-discharge strap when removing or installing memory modules. Electrostatic-discharge gloves can also be used.
  - Never hold two or more memory modules together so that they touch. Do not stack memory modules directly on top of each other during storage.
  - Never touch the gold memory module connector contacts or allow these contacts to touch the outside of the memory module connector housing.
  - Handle memory modules with care: never bend, twist, or drop a memory module.

Before removing a memory module:

1. Remove the top cover. See “Remove the top cover” on page 52.
2. Remove the air baffle. See “Remove the air baffle” on page 55.

To remove a memory module, complete the following steps:

Watch the procedure. A video of the removal process is available:

- Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O
- Youku: http://list.youku.com/albumlist/show/id_50437162
Step 1. Open the retaining clips on each end of the memory module slot.

Attention: To avoid breaking the retaining clips or damaging the memory module slots, handle the clips gently.

Step 2. Grasp the memory module at both ends and carefully lift it out of the slot.

Step 3. Install a memory module filler or a new memory module to cover the slot.

If you are instructed to return the old memory module, follow all packaging instructions and use any packaging materials that are provided.

Memory module installation rules

Memory modules must be installed in a specific order based on the memory configuration that you implement on your server.

Your server supports up to 6 memory modules when one processor is installed, and up to 12 memory modules when two processors are installed. It supports the following types of memory modules depending on the processors installed:

For Intel Xeon SP Gen 1 processors

- Minimum: 8 GB
- Maximum:
  - 384 GB using registered DIMMs (RDIMMs)
  - 768 GB using load-reduced DIMMs (LRDIMMs)
- Type (depending on the model):
  - TruDDR4 2666, single-rank or dual-rank, 8 GB/16 GB/32 GB RDIMMs
  - TruDDR4 2666, quad-rank, 64 GB LRDIMMs
- Slots: 12 slots
For Intel Xeon SP Gen 2 processors

- Minimum: 8 GB
- Maximum: 768 GB
- Type (depending on the model):
  - TruDDR4 2666, single-rank or dual-rank, 16 GB/32 GB RDIMMs
  - TruDDR4 2933, single-rank or dual-rank, 8 GB/16 GB/32 GB/64 GB RDIMMs
- Slots: 12 slots

For a list of supported memory, see: http://www.lenovo.com/us/en/serverproven/

Notes: Before installing a memory module, ensure that all memory modules to be installed must be the same type. Your server supports the following types of memory modules:

- DDR4 RDIMM with ECC technology
- DDR4 LRDIMM with ECC technology

The following illustration helps you to locate the memory module slots on the system board.

![Memory module slots on the system board](image)

The following memory configurations are available:

- “Independent mode” on page 81
- “Mirroring mode” on page 82
- “Rank sparing mode” on page 83

Independent mode

Independent mode provides high performance memory capability. You can populate all channels with no matching requirements. Individual channels can run at different memory module timings, but all channels must run at the same interface frequency.

The following table shows the memory module population sequence for independent mode when only one processor (CPU1) is installed.

Note: If there are three identical memory modules to be installed for CPU1, and the three memory modules have the same Lenovo part number, install the three memory modules in slots 1, 2, and 3.
Table 12. Independent mode with one processor

</tbody>
</table>

Mirroring mode

In mirroring mode, each memory module in a pair must be identical in size and architecture. The channels are grouped in pairs with each channel receiving the same data. One channel is used as a backup of the other, which provides redundancy.

Note: All memory modules to be installed must be the same type with the same capacity, frequency, voltage, and rank.
The following table shows the memory module population sequence for mirroring mode when one processor (CPU1) is installed.

**Table 14. Mirroring mode with one processor**

<table>
<thead>

**Rank sparing mode**

In rank sparing mode, one rank of a memory module works as the spare rank for the other ranks on the same channel. The spare rank is not available as system memory.

**Notes:**

- All memory modules to be installed must be the same type with the same capacity, frequency, voltage, and number of ranks.
- Single-rank memory modules do not support rank sparing mode.

**Table 16. Rank sparing mode with one processor**

Install a memory module

Use this information to install a memory module.

Attention:

• Disconnect all power cords for this task.

• Memory modules are sensitive to static discharge and require special handling. Refer to the standard guidelines for “Handling static-sensitive devices” on page 43:
  
  – Always wear an electrostatic-discharge strap when removing or installing memory modules. Electrostatic-discharge gloves can also be used.
  
  – Never hold two or more memory modules together so that they do not touch each other. Do not stack memory modules directly on top of each other during storage.
  
  – Never touch the gold memory module connector contacts or allow these contacts to touch the outside of the memory module connector housing.
  
  – Handle memory modules with care: never bend, twist, or drop a memory module.
  
  – Do not use any metal tools (such as jigs or clamps) to handle the memory modules, because the rigid metals may damage the memory modules.
  
  – Do not insert memory modules while holding packages or passive components, which can cause package cracks or detachment of passive components by the high insertion force.

Before installing a memory module:

1. Touch the static-protective package that contains the new memory module to any unpainted surface on the outside of the server. Then, take the new memory module out of the package and place it on a static-protective surface.

2. Locate the memory module slot on the system board by referring to “Memory module installation rules” on page 80. Ensure that you observe the installation rules and sequence.

To install a memory module, complete the following steps:

Watch the procedure. A video of the installation process is available:

• Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O
• Youku: http://list.youku.com/albumlist/show/id_50437162
Step 1. Open the retaining clips on each end of the memory module slot.

**Attention:** To avoid breaking the retaining clips or damaging the memory module slots, open and close the clips gently.

Step 2. Align the memory module with the slot, and gently place the memory module on the slot with both hands.

Step 3. Firmly press both ends of the memory module straight down into the slot until the retaining clips snap into the locked position.

**Note:** If there is a gap between the memory module and the retaining clips, the memory module has not been correctly inserted. In this case, open the retaining clips, remove the memory module, and then reinsert it.

After installing a memory module, complete the parts installation. See “Complete the parts replacement” on page 143.
CMOS battery replacement

Use this information to remove and install the CMOS battery.

Remove the CMOS battery

Use this information to remove the CMOS battery.

The following tips describe information that you must consider when removing the CMOS battery.

- Lenovo has designed this product with your safety in mind. The lithium CMOS battery must be handled correctly to avoid possible danger. If you replace the CMOS battery, you must adhere to the following instructions.

  **Note:** In the U.S., call 1-800-IBM-4333 for information about battery disposal.

- If you replace the original lithium battery with a heavy-metal battery or a battery with heavy-metal components, be aware of the following environmental consideration. Batteries and accumulators that contain heavy metals must not be disposed of with normal domestic waste. They will be taken back free of charge by the manufacturer, distributor, or representative, to be recycled or disposed of in a proper manner.

- To order replacement batteries, call 1-800-IBM-SERV within the U.S., and 1-800-465-7999 or 1-800-465-6666 within Canada. Outside the U.S. and Canada, call your support center or business partner.

  **Note:** After you replace the CMOS battery, you must reconfigure the server and reset the system date and time.

S004

**CAUTION:**

When replacing the lithium battery, use only Lenovo specified part number or an equivalent type battery recommended by the manufacturer. If your system has a module containing a lithium battery, replace it only with the same module type made by the same manufacturer. The battery contains lithium and can explode if not properly used, handled, or disposed of. **Do not:**

- Throw or immerse into water
- Heat to more than 100°C (212°F)
- Repair or disassemble

Dispose of the battery as required by local ordinances or regulations.

S002
CAUTION:
The power-control button on the device and the power switch on the power supply do not turn off the electrical current supplied to the device. The device also might have more than one power cord. To remove all electrical current from the device, ensure that all power cords are disconnected from the power source.

To remove the CMOS battery, complete the following steps:

Watch the procedure. A video of the removal process is available:
- Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O
- Youku: http://list.youku.com/albumlist/show/id_50437162

Step 1. Remove the top cover. See “Remove the top cover” on page 52.
Step 2. Locate the CMOS battery, see “System board components” on page 23.
Step 3. Press the battery clip as shown and carefully lift CMOS battery out of the socket.

Attention: Do not tilt or push the CMOS battery using excessive force. Failing to remove the CMOS battery properly might damage the socket on the system board. Any damage to the socket might require replacing the system board.

Figure 59. CMOS battery removal

After removing the CMOS battery:
1. Install a new CMOS battery.
2. Dispose of the CMOS battery as required by local ordinances or regulations.
Install the CMOS battery

Use this information to install the CMOS battery.

The following tips describe information that you must consider when installing the CMOS battery.

- Lenovo has designed this product with your safety in mind. The lithium battery must be handled correctly to avoid possible danger. If you install the CMOS battery, you must adhere to the following instructions.

The battery contains lithium and can explode if not properly used, handled, or disposed of. Do not:

- Throw or immerse into water
- Heat to more than 100°C (212°F)
- Repair or disassemble

Dispose of the battery as required by local ordinances or regulations.

S002

CAUTION:
The power-control button on the device and the power switch on the power supply do not turn off the electrical current supplied to the device. The device also might have more than one power cord. To
remove all electrical current from the device, ensure that all power cords are disconnected from the power source.

To install the CMOS battery, complete the following steps:

**Watch the procedure.** A video of the installation process is available:
- Youtube: [https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHIWC6maY_O](https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHIWC6maY_O)
- Youku: [http://list.youku.com/albumlist/show/id_50437162](http://list.youku.com/albumlist/show/id_50437162)

Step 1. Touch the static-protective package that contains the new CMOS battery to any unpainted surface on the outside of the server. Then, take the new CMOS battery out of the package and place it on a static-protective surface.

Step 2. Install the new CMOS battery. Ensure that the battery is seated in place.

**Attention:** Do not tilt or push the CMOS battery using excessive force. Any damage to the socket might require replacing the system board.

![Figure 60. CMOS battery installation](image)

After installing the CMOS battery:
1. Complete the parts installation. See “Complete the parts replacement” on page 143.
2. Use the Setup utility to set the date, time, and any passwords.

---

**TCM/TPM adapter replacement (for Chinese Mainland only)**

Use this information to remove and install the TCM/TPM adapter (sometimes called a daughter card).

**Remove the TCM/TPM adapter (for Chinese Mainland only)**

Use this information to remove the TCM/TPM adapter.

To remove the TCM/TPM adapter, complete the following steps:

Step 1. Remove the top cover. See “Remove the top cover” on page 52.

Step 2. Locate the TCM/TPM connector on the system board, press the release latch on the TCM/TPM adapter, and lift it straight up.

**Notes:**
• Carefully handle the TCM/TPM adapter by its edges.
• Your TCM/TPM adapter might look slightly different from the illustration.

If you are instructed to return the old TCM/TPM adapter, follow all packaging instructions and use any packaging materials that are provided.

Install the TCM/TPM adapter (for Chinese Mainland only)
Use this information to install the TCM/TPM adapter.

![Diagram of TCM/TPM adapter removal](image)

Before installing the TCM/TPM adapter, touch the static-protective package that contains the new TCM/TPM adapter to any unpainted surface on the outside of the server. Then, take the new TCM/TPM adapter out of the package and place it on a static-protective surface.

To install the TCM/TPM adapter, complete the following steps:
Step 1. Locate the TCM/TPM connector on the system board.
Step 2. Insert the TCM/TPM adapter into the TCM/TPM connector on the system board.

Notes:
• Carefully handle the TCM/TPM adapter by its edges.
Your TCM/TPM adapter might look slightly different from the illustration.

After installing the TCM/TPM adapter, complete the parts replacement. See “Complete the parts replacement” on page 143.
Hot-swap power supply replacement

Use this information to remove and install the hot-swap power supply.

Remove a hot-swap power supply

Use this information to remove a hot-swap power supply.

```
“Read the installation Guidelines” on page 41

“ATTENTION: Static Sensitive Device
Ground package before opening” on page 43
```

S035

CAUTION:
Never remove the cover on a power supply or any part that has this label attached. Hazardous voltage, current, and energy levels are present inside any component that has this label attached. There are no serviceable parts inside these components. If you suspect a problem with one of these parts, contact a service technician.

S002

CAUTION:
The power-control button on the device and the power switch on the power supply do not turn off the electrical current supplied to the device. The device also might have more than one power cord. To remove all electrical current from the device, ensure that all power cords are disconnected from the power source.

S001
**DANGER**

Electrical current from power, telephone, and communication cables is hazardous. To avoid a shock hazard:

- Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.
- Connect all power cords to a properly wired and grounded electrical outlet.
- Connect any equipment that will be attached to this product to properly wired outlets.
- When possible, use one hand only to connect or disconnect signal cables.
- Never turn on any equipment when there is evidence of fire, water, or structural damage.
- Disconnect the attached power cords, telecommunications systems, networks, and modems before you open the device covers, unless instructed otherwise in the installation and configuration procedures.
- Connect and disconnect cables as described in the following table when installing, moving, or opening covers on this product or attached devices.

<table>
<thead>
<tr>
<th>To Connect:</th>
<th>To Disconnect:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Turn everything OFF.</td>
<td>1. Turn everything OFF.</td>
</tr>
<tr>

<td>4. Remove all cables from devices.</td>
</tr>
<tr>
<td>5. Turn device ON.</td>
<td></td>
</tr>
</tbody>
</table>

Figure 63. Hot-swap power supply label on the cover

**Attention:** This type of power supply is hot-swap only when two power supplies are installed for redundancy. If only one power supply is installed, you must power off the server before removing the power supply.

The following tips describe the information that you must consider when you remove a power supply with dc input.

**CAUTION:**

- 240 V dc input (input range: 180-300 V dc) is supported in Chinese Mainland ONLY. Power supply with 240 V dc input cannot support hot plugging power cord function. Before removing the power supply with dc input, please turn off server or disconnect dc power sources at the breaker panel or by turning off the power source. Then, remove the power cord.

- In order for the ThinkSystem products to operate error free in both a DC or AC electrical environment, a TN-S earthing system which complies to 60364-1 IEC 2005 standard has to be present or installed.
在直流输入状态下，若电源供应器插座不支持热插拔功能，请务必不要对设备电源线进行热插拔。此操作可能导致设备损坏及数据丢失。因错误执行热插拔导致的设备故障或损坏，不属于保修范围。

NEVER CONNECT AND DISCONNECT THE POWER SUPPLY CABLE AND EQUIPMENT WHILE YOUR EQUIPMENT IS POWERED ON WITH DC SUPPLY (hot-plugging). Otherwise you may damage the equipment and result in data loss, the damages and losses result from incorrect operation of the equipment will not be covered by the manufacturers' warranty.

CAUTION:
Never remove the cover on a power supply or any part that has this label attached. Hazardous voltage, current, and energy levels are present inside any component that has this label attached. There are no serviceable parts inside these components. If you suspect a problem with one of these parts, contact a service technician.

CAUTION:
The power-control button on the device does not turn off the electrical current supplied to the device. The device also might have more than one connection to dc power. To remove all electrical current from the device, ensure that all connections to dc power are disconnected at the dc power input terminals.

DANGER

Electrical current from power, telephone, and communication cables is hazardous. To avoid a shock hazard:

• Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.
• Connect all power cords to a properly wired and grounded power source.
• Connect to properly wired power sources any equipment that will be attached to this product.
• When possible, use one hand only to connect or disconnect signal cables.
• Never turn on any equipment when there is evidence of fire, water, or structural damage.
• Disconnect the attached ac power cords, dc power sources, network connections, telecommunications systems, and serial cables before you open the device covers, unless you are instructed otherwise in the installation and configuration procedures.
• Connect and disconnect cables as described in the following table when installing, moving, or opening covers on this product or attached devices.

<table>
<thead>
<tr>
<th>To Connect:</th>
<th>To Disconnect:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Turn OFF all power sources and equipment that is to be attached to this product.</td>
<td>1. Turn OFF all power sources and equipment that is to be attached to this product.</td>
</tr>
<tr>
<td>2. Attach signal cables to the product.</td>
<td>• For ac systems, remove all power cords from the chassis power receptacles or interrupt power at the ac power distribution unit.</td>
</tr>
<tr>
<td>3. Attach power cords to the product.</td>
<td>• For dc systems, disconnect dc power sources at the breaker panel or by turning off the power source. Then, remove the dc cables.</td>
</tr>
<tr>
<td>• For ac systems, use appliance inlets.</td>
<td>2. Remove the signal cables from the connectors.</td>
</tr>
<tr>
<td>• For dc systems, ensure correct polarity of -48 V dc connections: RTN is + and -48 V dc is -. Earth ground should use a two-hole lug for safety.</td>
<td>3. Remove all cables from the devices.</td>
</tr>
<tr>
<td>4. Attach signal cables to other devices.</td>
<td></td>
</tr>
<tr>
<td>5. Connect power cords to their sources.</td>
<td></td>
</tr>
<tr>
<td>6. Turn ON all the power sources.</td>
<td></td>
</tr>
</tbody>
</table>

To remove a hot-swap power supply, complete the following steps:

Watch the procedure. A video of the removal process is available:
• Youtube:  [https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHwc6maY_O](https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHwc6maY_O)
• Youku:  [http://list.youku.com/albumlist/show/id_50437162](http://list.youku.com/albumlist/show/id_50437162)
Step 1. If the server is in a rack, adjust the cable management arm (CMA) to gain access to the power supply.

If you have installed the 1U CMA Upgrade Kit for Toolless Slide Rail or Toolless Slide Rail Kit with 1U CMA, do the following:

![Figure 64. CMA adjustment](image)

a. Press down the stop bracket 1 and rotate it to the open position.

b. Rotate the CMA out of the way to gain access to the power supply.

Step 2. Disconnect the power cord from the hot-swap power supply.

**Note:** If you are replacing two power supplies, do the power supply replacement one by one to ensure that the power supply to the server is not interrupted. Do not disconnect the power cord from the secondly replaced power supply until the power output LED for the firstly replaced power supply is lit. For the location of the power output LED, refer to “Rear view LEDs” on page 21.
Step 3. Press the release tab toward the handle and carefully pull the handle at the same time to slide the hot-swap power supply out of the chassis.

Notes: Slightly pull the power supply upwards when sliding the power supply out of the chassis, if you have installed one of the following CMA kits:
- 1U CMA Upgrade Kit for Toolless Slide Rail
- Toolless Slide Rail Kit with 1U CMA

After removing the power supply:
- Install a power supply filler or a new power supply to cover the power supply bay.

Important: To ensure proper cooling during normal server operation, both of the power supply bays must be occupied. This means that each bay must have a power supply installed; or one has a power supply installed and the other has a power supply filler installed.
- If you are instructed to return the old power supply, follow all packaging instructions and use any packaging materials that are provided.
Install a hot-swap power supply

Use this information to install a hot-swap power supply.

Read the installation Guidelines on page 41

ATTENTION: Static Sensitive Device
Ground package before opening on page 43

The following tips describe the type of power supply that the server supports and other information that you must consider when you install a power supply:

- The standard shipping has only one power supply installed in the server. For redundancy and hot-swap support, you must install an additional hot-swap power supply. Certain customized models might be shipped with two power supplies installed.

- Ensure that the devices that you are installing are supported. For a list of supported optional devices for the server, go to: http://www.lenovo.com/us/en/serverproven/

Notes:

- Ensure that the two power supplies installed on the server have the same wattage.

- If you are replacing the existing power supply with a new power supply of different wattage, attach the power rating label that comes with this option onto the existing label on the top cover near the power supply.

Figure 66. Hot-swap power supply label on the cover

CAUTION:

Never remove the cover on a power supply or any part that has this label attached. Hazardous voltage, current, and energy levels are present inside any component that has this label attached. There are no serviceable parts inside these components. If you suspect a problem with one of these parts, contact a service technician.
The power-control button on the device and the power switch on the power supply do not turn off the electrical current supplied to the device. The device also might have more than one power cord. To remove all electrical current from the device, ensure that all power cords are disconnected from the power source.

S001

DANGER

Electrical current from power, telephone, and communication cables is hazardous. To avoid a shock hazard:

- Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.
- Connect all power cords to a properly wired and grounded electrical outlet.
- Connect any equipment that will be attached to this product to properly wired outlets.
- When possible, use one hand only to connect or disconnect signal cables.
- Never turn on any equipment when there is evidence of fire, water, or structural damage.
- Disconnect the attached power cords, telecommunications systems, networks, and modems before you open the device covers, unless instructed otherwise in the installation and configuration procedures.
- Connect and disconnect cables as described in the following table when installing, moving, or opening covers on this product or attached devices.

<table>
<thead>
<tr>

The following tips describe the information that you must consider when you install a power supply with dc input.

CAUTION:

- 240 V dc input (input range: 180-300 V dc) is supported in Chinese Mainland ONLY. Power supply with 240 V dc input cannot support hot plugging power cord function. Before removing the power supply with dc input, please turn off server or disconnect dc power sources at the breaker panel or by turning off the power source. Then, remove the power cord.
- In order for the ThinkSystem products to operate error free in both a DC or AC electrical environment, a TN-S earthing system which complies to 60364-1 IEC 2005 standard has to be present or installed.
在直流输入状态下，若电源供应器插座不支持热插拔功能，请务必不要对设备电源线进行热插拔。此操作可能导致设备损坏及数据丢失。因错误执行热插拔导致的设备故障或损坏，不属于保修范围。

NEVER CONNECT AND DISCONNECT THE POWER SUPPLY CABLE AND EQUIPMENT WHILE YOUR EQUIPMENT IS POWERED ON WITH DC SUPPLY (hot-plugging). Otherwise you may damage the equipment and result in data loss, the damages and losses result from incorrect operation of the equipment will not be covered by the manufacturers’ warranty.

S035

CAUTION:
Never remove the cover on a power supply or any part that has this label attached. Hazardous voltage, current, and energy levels are present inside any component that has this label attached. There are no serviceable parts inside these components. If you suspect a problem with one of these parts, contact a service technician.

S019

CAUTION:
The power-control button on the device does not turn off the electrical current supplied to the device. The device also might have more than one connection to dc power. To remove all electrical current from the device, ensure that all connections to dc power are disconnected at the dc power input terminals.

S029
DANGER

Electrical current from power, telephone, and communication cables is hazardous.
To avoid a shock hazard:

- Do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.
- Connect all power cords to a properly wired and grounded power source.
- Connect to properly wired power sources any equipment that will be attached to this product.
- When possible, use one hand only to connect or disconnect signal cables.
- Never turn on any equipment when there is evidence of fire, water, or structural damage.
- Disconnect the attached ac power cords, dc power sources, network connections, telecommunications systems, and serial cables before you open the device covers, unless you are instructed otherwise in the installation and configuration procedures.
- Connect and disconnect cables as described in the following table when installing, moving, or opening covers on this product or attached devices.

To Connect:

1. Turn OFF all power sources and equipment that is to be attached to this product.
2. Attach signal cables to the product.
3. Attach power cords to the product.
   - For ac systems, use appliance inlets.
   - For dc systems, ensure correct polarity of -48 V dc connections: RTN is + and -48 V dc is -. Earth ground should use a two-hole lug for safety.
4. Attach signal cables to other devices.
5. Connect power cords to their sources.
6. Turn ON all the power sources.

To Disconnect:

1. Turn OFF all power sources and equipment that is to be attached to this product.
   - For ac systems, remove all power cords from the chassis power receptacles or interrupt power at the ac power distribution unit.
   - For dc systems, disconnect dc power sources at the breaker panel or by turning off the power source. Then, remove the dc cables.
2. Remove the signal cables from the connectors.
3. Remove all cables from the devices.

To install a hot-swap power supply, complete the following steps:

Watch the procedure. A video of the installation process is available:
- Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O
- Youku: http://list.youku.com/albumlist/show/id_50437162

Step 1. Touch the static-protective package that contains the new power supply to any unpainted surface on the outside of the server. Then, take the new power supply out of the package and place it on a static-protective surface.
Step 2. If the server is in a rack, adjust the CMA to gain access to the power supply bay.

If you have installed the 1U CMA Upgrade Kit for Toolless Slide Rail or Toolless Slide Rail Kit with 1U CMA, do the following:

Figure 67. CMA adjustment

a. Press down the stop bracket 1 and rotate it to the open position.
b. Rotate the CMA out of the way to gain access to the power supply bay.

Step 3. If there is a power supply filler installed, remove it.

Figure 68. Hot-swap power supply filler removal
Step 4. Slide the new hot-swap power supply into the bay until the release latch clicks into place.

Figure 69. Hot-swap power supply installation

After installing the power supply:

1. Connect the power cord to the new power supply and ensure that it is connected to a properly grounded electrical outlet.

2. If the server is powered off, power on the server. Ensure that both the power input LED and the power output LED on the power supply are lit, indicating that the power supply is operating properly.
**PCIe adapter replacement**

Use this information to remove and install a PCIe adapter.

The PCIe adapter can be a host bus adapter (HBA), a PCIe RAID adapter, an Ethernet adapter, and any other supported PCIe adapters. For information about the PCIe slots and supported PCIe adapters, see “Rear view” on page 17.

**Notes:**
- Depending on the specific type, the PCIe adapter might look different from the illustrations in this topic.
- Use any documentation that comes with the PCIe adapter and follow those instructions in addition to the instructions in this topic.

**Remove a PCIe adapter**

Use this information to remove a PCIe adapter.

> “Read the installation Guidelines” on page 41
> “Power off the server for this task” on page 11
> “ATTENTION: Static Sensitive Device Ground package before opening” on page 43

Before removing a PCIe adapter:

1. Remove the top cover. See “Remove the top cover” on page 52.
2. Remove the riser assembly. See “Remove a riser adapter” on page 107.

To remove a PCIe adapter, complete the following steps:

*Table 18. PCIe adapter removal*

Step 1. (Skip this step for riser 2 assembly.) Pivot the latch on the riser bracket to the open position.

Step 2. Grasp the PCIe adapter by its edges and carefully pull it out of the PCIe slot on the riser card.

If you are instructed to return the old PCIe adapter, follow all packaging instructions and use any packaging materials that are provided.
Install a PCIe adapter

Use this information to install a PCIe adapter.

Before installing a PCIe adapter,

1. Locate the correct PCIe slot for the PCIe adapter. For information about the PCIe slots and supported PCIe adapters, see “Rear view” on page 17.
2. Touch the static-protective package that contains the new PCIe adapter to any unpainted surface on the outside of the server. Then, take the new PCIe adapter out of the package and place it on a static-protective surface.

To install a PCIe adapter, complete the following steps:

<table>
<thead>
<tr>
<th>Table 19. PCIe adapter installation</th>
</tr>
</thead>
</table>

Step 1. Align the PCIe adapter with the PCIe slot on the riser card. Then, carefully press the PCIe adapter straight into the slot until it is securely seated and its bracket also is secured.

Step 2. (Skip this step for riser 2 assembly.) Pivot the latch on the riser bracket to the closed position.

After installing the PCIe adapter:

1. Reinstall the riser assembly. See “Install a riser adapter” on page 109.
2. Complete the parts replacement. See “Complete the parts replacement” on page 143.
Riser card replacement

Use this information to remove and install a riser card.

Your server comes with one of the following riser assembly configurations:

**Configuration 1**
- Riser 1 assembly: LP + LP
- Riser 2 assembly: LP (available on some models)

**Configuration 2**
- Riser 1 assembly: LP + FHHL

For information about the supported riser cards for each configuration, see “Rear view” on page 17.

There are three types of riser assemblies. The removal and installation procedure of the riser card is similar for all types of riser assemblies. The following procedures are based on the riser assembly in configuration 2.

**Remove a riser card**

Use this information to remove a riser card.

To remove a riser card, complete the following steps:

**Watch the procedure.** A video of the removal process is available:
- Youtube: [https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O](https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O)
- Youku: [http://list.youku.com/albumlist/show/id_50437162](http://list.youku.com/albumlist/show/id_50437162)

**Note:** The riser assembly you want to remove might be different from the illustrations below, but the removal method is the same.

Step 1. Remove the top cover. See “Remove the top cover” on page 52.
Step 2. Grasp the riser assembly by its edges and carefully lift it up.

Figure 76. Riser assembly removal

Step 3. If there is any PCIe adapter installed on the riser card, record the cable connections first. Then, disconnect all cables from the PCIe adapter and completely remove the riser assembly out of the chassis.

Step 4. Remove the PCIe adapter that is installed on the riser card. See “Remove a PCIe adapter” on page 105.

Step 5. Remove the two screws that secure the riser card to the bracket. Then, remove the riser card.

Figure 77. Riser card removal

If you are instructed to return the old riser card, follow all packaging instructions and use any packaging materials that are provided.
Install a riser card

Use this information to install a riser card.

Watch the procedure. A video of the installation process is available:
• Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O
• Youku: http://list.youku.com/albumlist/show/id_50437162

Note: The riser assembly you want to install might be different from the illustrations below, but the installation method is the same.

Step 1. Touch the static-protective package that contains the new riser card to any unpainted surface on the outside of the server. Then, take the new riser card out of the package and place it on a static-protective surface.

Step 2. Note the notch 1 on the riser card and ensure that the orientation of the riser card is correct as shown. Then, align the screw holes in the new riser card with the corresponding ones in the bracket and install the two screws to secure the riser card to the bracket.

Figure 78. Riser card installation

Step 3. Install a PCIe adapter on the riser card. See “Install a PCIe adapter” on page 106.
Step 5. Position the riser assembly on the chassis. Align the two pins on the bracket with the two holes in the chassis and align the riser card with the riser slot on the system board. Then, carefully press the riser assembly straight down into the slot until it is fully seated.

Figure 79. Riser assembly installation

After installing the riser card, complete the parts replacement. See “Complete the parts replacement” on page 143.
M.2 backplane and M.2 drive replacement

Use this information to remove and install the M.2 backplane and M.2 drive (an assembled M.2 backplane and M.2 drive is also known as M.2 module).

Remove the M.2 backplane and M.2 drive

Use this information to remove the M.2 backplane and M.2 drive.

Before removing the M.2 backplane and M.2 drive:
1. Remove the top cover. See “Remove the top cover” on page 52.
2. For easier operation, remove the riser assembly next to the M.2 backplane. See “Remove a riser adapter” on page 107.

To remove the M.2 backplane and M.2 drive, complete the following steps:

Watch the procedure. A video of the removal process is available:
• Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O
• Youku: http://list.youku.com/albumlist/show/id_50437162

Step 1. Grasp the M.2 backplane at both ends and pull it straight up to remove it from the system board.

Step 2. Remove the M.2 drive from the M.2 backplane.
Figure 81. M.2 drive removal

a. Press both sides of the retainer ①.

b. Slide the retainer backward to loosen the M.2 drive from the M.2 backplane.

Note: If the M.2 backplane has two M.2 drives, they will both release outward when you slide the retainer backward.

c. Rotate the M.2 drive away from the M.2 backplane.

d. Pull it away from the connector ② at an angle of approximately 30 degrees.

If you are instructed to return the old M.2 backplane or M.2 drive, follow all packaging instructions and use any packaging materials that are provided.
Adjust the retainer on the M.2 backplane

Use this information to adjust the retainer on the M.2 backplane.

Before adjusting the retainer on the M.2 backplane, locate the correct keyhole that the retainer should be installed into to accommodate the particular size of the M.2 drive you wish to install.

To adjust the retainer on the M.2 backplane, complete the following steps:

**Watch the procedure.** A video of the adjustment process is available:
- Youtube: [https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O](https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O)
- Youku: [http://list.youku.com/albumlist/show/id_50437162](http://list.youku.com/albumlist/show/id_50437162)

![Figure 82. M.2 retainer adjustment](image)

**Figure 82. M.2 retainer adjustment**

Step 1. Press both sides of the retainer 1.
Step 2. Move the retainer forward until it is in the large opening of the keyhole.
Step 3. Take the retainer out of the keyhole.
Step 4. Insert the retainer into the correct keyhole.
Step 5. Press both sides of the retainer.
Step 6. Slide the retainer backwards until it is seated in place.
Install the M.2 backplane and M.2 drive

Use this information to install the M.2 backplane and M.2 drive.

Before installing the M.2 backplane and M.2 drive:

1. Touch the static-protective package that contains the new M.2 backplane and M.2 drive to any unpainted surface on the outside of the server. Then, take the new M.2 backplane and M.2 drive out of the package and place them on a static-protective surface.
2. Adjust the retainer on the M.2 backplane to accommodate the particular size of the M.2 drive you wish to install. See “Adjust the retainer on the M.2 backplane” on page 113.
3. Locate the connector on each side of the M.2 backplane.

Notes:

• Some M.2 backplanes support two identical M.2 drives. When two M.2 drives are installed, align and support both M.2 drives when sliding the retainer forward to secure the M.2 drives.
• Install the M.2 drive in slot 0 first.

To install the M.2 backplane and M.2 drive, complete the following steps:

Watch the procedure. A video of the installation process is available:

• Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O
• Youku: http://list.youku.com/albumlist/show/id_50437162
Step 1. Insert the M.2 drive at an angle of approximately 30 degrees into the connector.

Note: If your M.2 backplane supports two M.2 drives, insert the M.2 drives into the connectors at both sides.

Step 2. Rotate the M.2 drive down until the notch 1 catches on the lip of the retainer 2.

Step 3. Slide the retainer forward (toward the connector) to secure the M.2 drive into place.

Attention: When sliding the retainer forward, ensure that the two nubs 3 on the retainer enter the small holes 4 on the M.2 backplane. Once they enter the holes, you will hear a soft “click” sound.
Step 4. Align the blue plastic supports at each end of the M.2 backplane with the guide pins on the system board. Then, insert the M.2 backplane into the M.2 slot on the system board and press it down to fully seat it.

After installing the M.2 drive and M.2 backplane:

1. Reinstall the riser assembly next to the M.2 backplane. See “Install a riser adapter” on page 109.
2. Complete the parts replacement. See “Complete the parts replacement” on page 143.
3. Use the Lenovo XClarity Provisioning Manager to configure the RAID. For more information, see: [http://sysmgt.lenovofiles.com/help/topic/LXPM/RAID_setup.html](http://sysmgt.lenovofiles.com/help/topic/LXPM/RAID_setup.html)
Serial port module replacement

Use this information to remove and install the serial port module.

**Note:** The serial port module is available only on some models.

Remove the serial port module

Use this information to remove the serial port module.

![Diagram](image)

To remove the serial port module, complete the following steps:

**Note:** The serial port module might be installed on riser 1 assembly or riser 2 assembly. The following steps are based on the scenario that the serial port module is installed on riser 2 assembly. The removal procedure is the same for the serial port module installed on riser 1 assembly.

1. **Step 1.** Remove the top cover. See “Remove the top cover” on page 52.
2. **Step 2.** Disconnect the cable of the serial port module from the system board.
3. **Step 3.** Grasp the riser 2 assembly with the serial port module and carefully lift the riser assembly out of the server.

*Figure 86. Riser assembly removal*
Step 4. Slide the serial port module out of the bracket.

![Serial port module removal](image)

*Figure 87. Serial port module removal*

After removing the serial port module:

1. Install a new serial port module, a filler, or a PCIe adapter to cover the place.
2. If you are instructed to return the old serial port module, follow all packaging instructions and use any packaging materials that are provided.
Install the serial port module

Use this information to install the serial port module.

Before installing the serial port module, touch the static-protective package that contains the new serial port module to any unpainted surface out of the server. Then, take the new serial port module out of the package and place it on a static-protective surface.

To install the serial port module, complete the following steps:

**Note:** The serial port module can be installed on riser 1 assembly or riser 2 assembly. The following steps are based on the scenario that the serial port module is to be installed on riser 2 assembly. The installation procedure is the same for the serial port module to be installed on riser 1 assembly.

Step 1. Locate the riser assembly and remove it from the server.

Step 2. If the riser assembly is covered with a PCIe slot bracket, remove the bracket first. Then, install the serial port module into the riser assembly.

Step 3. Insert the riser assembly into the riser slot on the system board. Ensure that the riser assembly is fully seated.
Step 4. Connect the cable of the serial port module to serial-port-module connector on the system board. To locate the connector, see “System board components” on page 23. If the serial port module is installed in PCIe slot 1, route the cable of the serial port module as shown.

![Figure 89. Cable routing for serial port module installed in PCIe slot 1](image)

After installing the serial port module:

1. Complete the parts replacement. See “Complete the parts replacement” on page 143.
2. To enable the serial port module, do one of the following according to the installed operating system:
   - For Linux operating system:
     Open the ipmitool and enter the following command to disable the Serial over LAN (SOL) feature:
     ```
     -I lanplus -H IP -U USERID -P PASSWORD sol deactivate
     ```
   - For Microsoft Windows operating system:
     a. Open the ipmitool and enter the following command to disable the SOL feature:
        ```
        -I lanplus -H IP -U USERID -P PASSWORD sol deactivate
        ```
     b. Open Windows PowerShell and enter the following command to disable the Emergency Management Services (EMS) feature:
        ```
        Bcdedit /ems no
        ```
     c. Restart the server to ensure that the EMS setting takes effect.
LOM adapter replacement

Use this information to remove and install the LOM adapter.

Remove the LOM adapter

Use this information to remove the LOM adapter.

Before removing the LOM adapter:
1. Remove the top cover. See “Remove the top cover” on page 52.
2. If riser 1 assembly is installed, remove it to access the LOM adapter slot.

To remove the LOM adapter, complete the following steps:

Watch the procedure. A video of the removal process is available:
- Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDwK6L3KtiHw6maY_O
- Youku: http://list.youku.com/albumlist/show/id_50437162

Step 1. Loosen the thumbscrew that secures the LOM adapter.
Step 2. Push the LOM adapter out of the connector on the system board.
Step 3. Slide the LOM adapter as shown and lift the LOM adapter out of the chassis.

If you are instructed to return the old LOM adapter, follow all packaging instructions and use any packaging materials that are provided.
Install the LOM adapter

Use this information to install the LOM adapter.

Before installing the LOM adapter:

1. If riser 1 assembly is installed, remove it to access the LOM adapter slot.
2. Touch the static-protective package that contains the new LOM adapter to any unpainted surface on the outside of the server. Then, take the new LOM adapter out of the package and place it on a static-protective surface.

To install the LOM adapter, complete the following steps:

**Watch the procedure.** A video of the installation process is available:
- Youtube: https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuoDWK6L3KtHWc6maY_O
- Youku: http://list.youku.com/albumlist/show/id_50437162

![Figure 91. LOM adapter installation](image)

Step 1. Insert the LOM adapter into the rear of the chassis at an angle as shown.
Step 2. Lower the LOM adapter and slide it to the rear of the chassis until the LOM adapter stops.
Step 3. Push the LOM adapter as shown to insert it into the connector on the system board.
Step 4. Tighten the thumbscrew to secure the LOM adapter.

After installing the LOM adapter, complete the parts replacement. See “Complete the parts replacement” on page 143.
Processor and heat sink replacement

Use the following procedures to replace an assembled processor and heat sink, known as a processor-heat-sink module (PHM), a processor, or a heat sink.

Attention:

- Before you begin replacing a processor, make sure that you have an alcohol cleaning pad (part number 00MP352) and gray thermal grease (part number 41Y9292).
- Cascade Lake processors are supported on the system board with part number 01PE840. If you use the system board with part number 00MX681, update your system firmware to the latest level before installing a Cascade Lake processor. Otherwise, the system cannot be powered on.

Important: The processor in your server can throttle, temporarily lowering speed to reduce heat output, in response to thermal conditions. In instances where the throttling period is of extremely short duration (100 ms or less), the only indication will be an entry in the event log. In these instances the event can be ignored and processor replacement is not required.

Remove a processor and heat sink

This task has instructions for removing an assembled processor and heat sink, known as a processor-heat-sink module (PHM), a processor, and a heat sink. All of these tasks require a Torx T30 driver.

Attention:

- Intel Xeon SP Gen 2 processors are supported on the system board with part number 01PE840. If you use the system board with part number 00MX681, update your system firmware to the latest level before installing a Intel Xeon SP Gen 2 processor. Otherwise, the system cannot be powered on.
- Each processor socket must always contain a cover or a PHM. When removing or installing a PHM, protect empty processor sockets with a cover.
- Do not touch the processor socket or processor contacts. Processor-socket contacts are very fragile and easily damaged. Contaminants on the processor contacts, such as oil from your skin, can cause connection failures.
- Remove and install only one PHM at a time. If the system board supports multiple processors, install the PHMs starting with the first processor socket.
- Do not allow the thermal grease on the processor or heat sink to come in contact with anything. Contact with any surface can compromise the thermal grease, rendering it ineffective. Thermal grease can damage components, such as electrical connectors in the processor socket. Do not remove the grease cover from a heat sink until you are instructed to do so.

Before you remove a PHM:

Note: The heat sink, processor, and processor retainer for your system might be different than those shown in the illustrations.

1. Remove the top cover. See “Remove the top cover” on page 52.
2. Remove the air baffle. See “Remove the air baffle” on page 55.
3. Remove any parts and disconnect any cables that might impede your access to the PHM.
Complete the following steps to remove a PHM.

**Watch the procedure.** A video of the removal process is available:
- Youtube: [https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O](https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O)
- Youku: [http://list.youku.com/albumlist/show/id_50437162](http://list.youku.com/albumlist/show/id_50437162)

Step 1. Remove the PHM from the system board.

*Figure 92. Removing a PHM*

**Attention:** To prevent damage to components, make sure that you follow the indicated loosening sequence.

a. Fully loosen the Torx T30 captive fasteners on the processor-heat-sink module *in the removal sequence shown* on the heat-sink label.

b. Lift the processor-heat-sink module from the processor socket.

After you remove a PHM:

- If you are removing the PHM as part of a system board replacement, set the PHM aside.
- If you are replacing the processor or heat sink, separate the processor and its retainer from the heat sink.
Figure 93. Separating a heat sink from a processor

1. Press the retaining clip at the corner of the processor retainer closest to the pry point; then, gently pry this corner of the retainer away from the heat sink with a flat-bladed screwdriver, using a twisting motion to break the processor-to-heat-sink seal.

2. Release the remaining retaining clips and lift the processor and retainer from the heat sink.

3. After separating the processor and retainer from the heat sink, hold the processor and retainer with the thermal-grease side down and the processor-contact side up to prevent the processor from falling out of the retainer.

   **Note:** The processor retainer will be removed and discarded in a later step and replaced with a new one.

4. If you are replacing the processor, you will be reusing the heat sink. Wipe the thermal grease from the bottom of the heat sink using an alcohol cleaning pad.

5. If you are replacing the heat sink, you will be reusing the processor. Wipe the thermal grease from the top of the processor using an alcohol cleaning pad.

If you are instructed to return the processor or heat sink, follow all packaging instructions and use any packaging materials that are provided.
Install a processor and heat sink

This task has instructions for installing an assembled processor and heat sink, known as a processor-heat-sink module (PHM), a processor, and a heat sink. All of these tasks require a Torx T30 driver.

Attention:

- Intel Xeon SP Gen 2 processors are supported on the system board with part number 01PE840. If you use the system board with part number 00MX681, update your system firmware to the latest level before installing an Intel Xeon SP Gen 2 processor. Otherwise, the system cannot be powered on.
- Each processor socket must always contain a cover or a PHM. When removing or installing a PHM, protect empty processor sockets with a cover.
- Do not touch the processor socket or processor contacts. Processor-socket contacts are very fragile and easily damaged. Contaminants on the processor contacts, such as oil from your skin, can cause connection failures.
- Remove and install only one PHM at a time. If the system board supports multiple processors, install the PHMs starting with the first processor socket.
- Do not allow the thermal grease on the processor or heat sink to come in contact with anything. Contact with any surface can compromise the thermal grease, rendering it ineffective. Thermal grease can damage components, such as electrical connectors in the processor socket. Do not remove the grease cover from a heat sink until you are instructed to do so.

Notes:

- PHMs are keyed for the socket where they can be installed and for their orientation in the socket.
- See http://www.lenovo.com/us/en/serverproven/ for a list of processors supported for your server. All processors on the system board must have the same speed, number of cores, and frequency.
- If you are going to install one of the following processors, replace your heat sink with a heat pipe heat sink (part number: 01KP650 or 01KP651):
  - Intel Xeon Platinum 8156 4C 105W 3.6 GHz processor
  - Intel Xeon Platinum 8256 4C 105W 3.8 GHz processor
  - Intel Xeon Gold 5120T 14C 105W 2.2 GHz processor
  - Intel Xeon Gold 5122 4C 105W 3.6 GHz processor
  - Intel Xeon Gold 5217 8C 115W 3.0 GHz processor
  - Intel Xeon Gold 5218T 16C 105W 2.1GHz processor
  - Intel Xeon Gold 5220T 18C 105W 2.2 GHz processor
  - Intel Xeon Gold 5222 4C 105W 3.8 GHz processor
  - Intel Xeon Gold 6126T 12C 125W 2.6 GHz processor
  - Intel Xeon Gold 6128 6C 115W 3.4 GHz processor
  - Intel Xeon Gold 6130T 16C 125W 2.1 GHz processor
  - Intel Xeon Gold 6138T 20C 125W 2.0 GHz processor
  - Intel Xeon Gold 6230N 20C 125W 2.3 GHz processor
  - Intel Xeon Gold 6230T 20C 125W 2.1 GHz processor
  - Intel Xeon Gold 6238T 22C 125W 1.9 GHz processor
Before you install a new PHM or replacement processor, update your system firmware to the latest level. See “Firmware updates” on page 7.

Installing an additional PHM can change the memory requirements for your system. See “Memory module installation rules” on page 80 for a list of processor-to-memory relationships.

Optional devices available for your system might have specific processor requirements. See the documentation that comes with the optional device for information.

Before you install a PHM:

**Note:** The heat sink, processor, and processor retainer for your system might be different than those shown in the illustrations.

1. Remove the existing PHM, if one is installed. See “Remove a processor and heat sink” on page 123.

   **Note:** Replacement processors come with both rectangular and square processor retainers. A rectangular retainer comes attached to the processor. The square retainer can be discarded.

2. If you are replacing a heat sink, replace the processor retainer. *Processor retainers should not be reused.*
   a. Remove the old processor retainer.

   **Note:** When the processor is out of its retainer, hold the processor by the long edges to prevent touching the contacts or the thermal grease, if it is applied.

   With the processor-contact side up, flex the ends of the retainer down and away from the processor to release the retaining clips; then, remove the processor from the retainer. Discard the old retainer.

   b. Install a new processor retainer.
1) Position the processor on the new retainer so that the triangular marks align; then, insert the unmarked end of the processor into the retainer.

2) Holding the inserted end of the processor in place, flex the opposite end of the retainer down and away from the processor until you can press the processor under the clip on the retainer.

   To prevent the processor from falling out of the retainer after it is inserted, keep the processor-contact side up and hold the processor-retainer assembly by the sides of the retainer.

3) If there is any old thermal grease on the processor, gently clean the top of the processor using an alcohol cleaning pad.

   Note: If you are applying new thermal grease on the top of the processor, make sure to do it after the alcohol has fully evaporated.

3. If you are replacing a processor:
   a. Remove the processor identification label from the heat sink and replace it with the new label that comes with the replacement processor.
   b. Apply the new thermal grease on the top of the new processor with syringe by forming four uniformly spaced dots, while each dot consists of about 0.1 ml of thermal grease.

4. If you are replacing a heat sink, remove the processor identification label from the old heat sink and place it on the new heat sink in the same location. The label is on the side of the heat sink closet to the triangular alignment mark.
If you are unable to remove the label and place it on the new heat sink, or if the label is damaged during transfer, write the processor serial number from the processor identification label on the new heat sink in the same location as the label would be placed using a permanent marker.

5. Assemble the processor and heat sink, if these components are separate.

Notes:

- If you are replacing a processor, install the heat sink onto the processor and retainer while the processor and retainer are in the shipping tray.

- If you are replacing a heat sink, remove the heat sink from its shipping tray and place the processor and retainer in the opposite half of the heat sink shipping tray with the processor-contact side down. To prevent the processor from falling out of the retainer, hold the processor-retainer assembly by its sides with the processor-contact side up until you turn it over to fit in the shipping tray.

![Figure 97. Assembling a PHM in the shipping tray](image)

- a. Align the triangular marks on the processor retainer and the heat sink or align the triangular mark on the processor retainer with the notched corner of the heat sink.

- b. Insert the processor-retainer clips into the holes on the heat sink.

- c. Press the retainer into place until the clips at all four corners engage.

Complete the following steps to install a PHM.

**Watch the procedure.** A video of the installation process is available:

- Youtube: [https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O](https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O)

- Youku: [http://list.youku.com/albumlist/show/id_50437162](http://list.youku.com/albumlist/show/id_50437162)
Step 1. Remove the processor socket cover, if one is installed on the processor socket, by placing your fingers in the half-circles at each end of the cover and lifting it from the system board.

Step 2. Install the processor-heat-sink module on the system board.

![Figure 98. Installing a PHM](image)

a. Align the triangular marks and guide pins on the processor socket with the PHM; then, insert the PHM into the processor socket.

**Attention:** To prevent damage to components, make sure that you follow the indicated tightening sequence.

b. Fully tighten the Torx T30 captive fasteners *in the installation sequence shown* on the heat-sink label. Tighten the screws until they stop; then, visually inspect to make sure that there is no gap between the screw shoulder beneath the heat sink and the processor socket. (For reference, the torque required for the nuts to fully tighten is 1.4 — 1.6 newton-meters, 12 — 14 inch-pounds).

After you install a PHM:

1. Complete the parts replacement. See “Complete the parts replacement” on page 143.
System board replacement

Use this information to remove and install the system board.

Important: Before you return the system board, make sure that you install the CPU socket dust covers from the new system board. To replace a CPU socket dust cover:

1. Take a dust cover from the CPU socket assembly on the new system board and orient it correctly above the CPU socket assembly on the removed system board.
2. Gently press down the dust cover legs to the CPU socket assembly, pressing on the edges to avoid damage to the socket pins. You might hear a click on the dust cover is securely attached.
3. Make sure that the dust cover is securely attached to the CPU socket assembly.

S017

CAUTION:
Hazardous moving fan blades nearby. Keep fingers and other body parts away.

S012

CAUTION:
Hot surface nearby.

Remove the system board

Use this information to remove the system board.

“Read the installation Guidelines” on page 41

“Power off the server for this task” on page 11

“ATTENTION: Static Sensitive Device Ground package before opening” on page 43

Before removing the system board:

1. Remove the top cover. See “Remove the top cover” on page 52.
2. Record where the cables are connected to the system board; then, disconnect them.

Attention: Disengage all latches, cable clips, release tabs, or locks on cable connectors beforehand. Failing to release them before removing the cables will damage the cable connectors on the system board. Any damage to the cable connectors may require replacing the system board.

3. Remove any of the following components that are installed on the system board and put them in a safe, static-protective place. See the related topics in Chapter 3 “Hardware replacement procedures” on page 41.
   - Air baffle
• System fans
• Processor-heat-sink module (PHM)

**Note:** Do not disassemble the PHM.
• DIMMs
• CMOS battery
• PCIe adapters
• Riser assembly
• M.2 backplane
• LOM adapter
• TCM/TPM (for Chinese Mainland only)

4. Pull out the power supplies a little bit. Ensure that they are disconnected from the system board.

To remove the system board, complete the following steps:

**Watch the procedure.** A video of the removal process is available:
• Youtube: [https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQRHuDWK6L3KtHWc6maY_O](https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQRHuDWK6L3KtHWc6maY_O)
• Youku: [http://list.youku.com/albumlist/show/id_50437162](http://list.youku.com/albumlist/show/id_50437162)

![Figure 99. System board removal](image)

**Figure 99. System board removal**

Step 1. Remove the screws that secure the system board, and put the screws in a safe place.

Step 2. Grasp the system board by the release pin 1 and the lift handle 2 at the same time and gently slide the system board to the front of the server. Then lift and tilt the system board upwards to remove it from the server.

If you are instructed to return the old system board, follow all packaging instructions and use any packaging materials that are provided.
**Important:** Before you return the system board, make sure that you install the CPU socket dust covers from the new system board. To replace a CPU socket dust cover:

1. Take a dust cover from the CPU socket assembly on the new system board and orient it correctly above the CPU socket assembly on the removed system board.
2. Gently press down the dust cover legs to the CPU socket assembly, pressing on the edges to avoid damage to the socket pins. You might hear a click on the dust cover is securely attached.
3. **Make sure** that the dust cover is securely attached to the CPU socket assembly.
Install the system board

Use this information to install the system board.

Before installing the system board, touch the static-protective package that contains the new system board to any unpainted surface on the outside of the server. Then, take the new system board out of the package and place it on a static-protective surface.

Watch the procedure. A video of the installation process is available:
- Youtube: [https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O](https://www.youtube.com/playlist?list=PLYV5R7hVcs-AQrHuDWK6L3KtHWc6maY_O)
- Youku: [http://list.youku.com/albumlist/show/id_50437162](http://list.youku.com/albumlist/show/id_50437162)

To install the system board, complete the following steps:

Step 1. Grasp the system board by the release pin 1 and the lift handle 2 at the same time, and tilt the system board at an angle of approximately 20 degrees as shown.

Step 2. Align the hole 3 on the system board with the corresponding mounting stud 5 on the chassis first, and then align the hole 4 by the same way.

   **Note:** Before you align the two holes, prevent the system board from touching the mounting studs on the chassis.

Step 3. Lower the system board into the chassis and slide it to the rear of the chassis until it clicks into position.

Step 4. Install the four screws in the following sequence.
After installing the system board:

1. Push the power supplies into the bays until they click into place.

2. Install any components that you removed from the failing system board. See the related topics in Chapter 3 “Hardware replacement procedures” on page 41.

3. Complete the parts replacement. See “Complete the parts replacement” on page 143.

4. Update the Universally Unique Identifier (UUID) and DMI/SMBIOS data with new vital product data (VPD). Use the Lenovo XClarity Provisioning Manager to update the UUID and DMI/SMBIOS data. See “Update the Universal Unique Identifier (UUID)” on page 135 and “Update the DMI/SMBIOS data” on page 137.

5. Enable TPM/TCM. See “Enable TPM/TCM” on page 139.

6. Optionally, enable Secure Boot.

**Update the Universal Unique Identifier (UUID)**

The Universal Unique Identifier (UUID) must be updated when the system board is replaced. Use the Lenovo XClarity Provisioning Manager to update the UUID in the UEFI-based server. Lenovo XClarity Essentials OneCLI can be used to update the UUID in the UEFI-based server as a command line option. Lenovo XClarity Essentials OneCLI is an online tool that supports several operating systems; make sure that you download the version for your operating system.

1. Start the server and press F1 to display the Lenovo XClarity Provisioning Manager system setup interface.

2. From the System Summary page, click **Update VPD**.

3. Update the UUID.

   **Note:** You can use Lenovo XClarity Essentials OneCLI to update the UUID for the server.

To download Lenovo XClarity Essentials OneCLI, go to the following site:

https://datacentersupport.lenovo.com/solutions/HT116433
Lenovo XClarity Essentials OneCLI sets the UUID in the Lenovo XClarity Controller. Select one of the following methods to access the Lenovo XClarity Controller and set the UUID:

- Operate from the target system, such as LAN or keyboard console style (KCS) access
- Remote access to the target system (TCP/IP based)

Step 1. Copy and unpack the OneCLI package, which also includes other required files, to the server. Make sure that you unpack the OneCLI and the required files to the same directory.

Step 2. After you have OneCLI in place, use the following command syntax to set the UUID:

```
onecli config set SYSTEM_PROD_DATA.SysInfoUUID <uuid_value> [access_method]
```

Where:

- `<uuid_value>`
  Up to 16-byte hexadecimal value assigned by you.

- `[access_method]`
  The access method that you selected to use from the following methods:

  - Online authenticated LAN access, type the command:
    
    Example that does not use the user ID and password default values:
    ```
    onecli config set SYSTEM_PROD_DATA.SysInfoUUID <uuid_value> --user <user_id> --password <password>
    ```
    
    Example that uses the user ID and password default values:
    ```
    onecli config set SYSTEM_PROD_DATA.SysInfoUUID <uuid_value>
    ```
  
  - Online KCS access (unauthenticated and user restricted):
    
    You do not need to specify a value for `access_method` when you use this access method.
    
    Example:
    ```
    onecli config set SYSTEM_PROD_DATA.SysInfoUUID <uuid_value>
    ```

    **Note:** The KCS access method uses the IPMI/KCS interface, which requires that the IPMI driver be installed.

  - Remote LAN access, type the command:
    
    **Note:** When using the remote LAN/WAN access method to access Lenovo XClarity Controller from a client, the `host` and the `xcc_external_ip` address are required parameters.
    
    ```
    [--imm xcc_user_id:xcc_password@xcc_external_ip]
    
    or
    ```
    ```
    [--bmc xcc_user_id:xcc_password@xcc_external_ip]
    ```

    Where:

    - `xcc_external_ip`
      The BMC/IMM/XCC external IP address. There is no default value. This parameter is required.
    
    - `xcc_user_id`
      The BMC/IMM/XCC account name (1 of 12 accounts). The default value is USERID.
    
    - `xcc_password`
      The BMC/IMM/XCC account password (1 of 12 accounts). The default value is PASSW0RD (with a zero 0 not an O).
Step 3. Restart the Lenovo XClarity Controller.
Step 4. Restart the server.

Update the DMI/SMBIOS data

The Desktop Management Interface (DMI) must be updated when the system board is replaced. Use the Lenovo XClarity Provisioning Manager to update the DMI in the UEFI-based server. Lenovo XClarity Essentials OneCLI can be used to update the UUID in the UEFI-based server as a command line option.

Lenovo XClarity Essentials OneCLI is an online tool that supports several operating systems; make sure that you download the version for your operating system.

1. Start the server and press F1 to display the Lenovo XClarity Provisioning Manager system setup interface.
2. From the System Summary page, click Update VPD.
3. Update the asset tag information.

   Note: You can use Lenovo XClarity Essentials OneCLI to update the asset tag for the server.

To download Lenovo XClarity Essentials OneCLI, go to the following site:

https://datacentersupport.lenovo.com/solutions/HT116433

Lenovo XClarity Essentials OneCLI sets the DMI in the Lenovo XClarity Controller. Select one of the following methods to access the Lenovo XClarity Controller and set the DMI:

- Operate from the target system, such as LAN or keyboard console style (KCS) access
- Remote access to the target system (TCP/IP based)

Step 1. After you have Lenovo XClarity Essentials OneCLI in place, type the following commands to set the DMI:

onecli config set SYSTEM_PROD_DATA.SysInfoProdName <m/t_model> [access_method]
onecli config set SYSTEM_PROD_DATA.SysInfoSerialNum <s/n> [access_method]
onecli config set SYSTEM_PROD_DATA.SysEncloseAssetTag <asset_tag> [access_method]

Where:

<m/t_model>
The server machine type and model number. Type mtm xxxxyyy, where xxxx is the machine type and yyy is the server model number.

<s/n>
The serial number on the server. Type sn zzzzzzzz, where zzzzzzzz is the serial number.

<asset_method>
The server asset tag number. Type asset aaaaaaaaaaaaaaaaaaaaaaaaaaaaa, where aaaaaaaaaaaaaaaaaaaaaaaaaaaa is the asset tag number.

[access_method]
The access method that you select to use from the following methods:

- Online authenticated LAN access, type the command:
[--imm xcc_user_id:xcc_password@xcc_internal_ip]

or

[--bmc xcc_user_id:xcc_password@xcc_internal_ip]

Where:

**xcc_internal_ip**
The BMC/IMM/XCC internal LAN/USB IP address. The default value is 169.254.95.118.

**xcc_user_id**
The BMC/IMM/XCC account name (1 of 12 accounts). The default value is USERID.

**xcc_password**
The BMC/IMM/XCC account password (1 of 12 accounts). The default value is PASSW0RD (with a zero 0 not an O).

**Notes:**

1. BMC, IMM, or XCC internal LAN/USB IP address, account name, and password are all valid for this command.

2. If you do not specify any of these parameters, OneCLI will use the default values. When the default values are used and OneCLI is unable to access the Lenovo XClarity Controller using the online authenticated LAN access method, OneCLI will automatically use the unauthenticated KCS access method.

Examples that do use the user ID and password default values:

onecli config set SYSTEM_PROD_DATA.SysInfoProdName <m/t_model>
onecli config set SYSTEM_PROD_DATA.SysInfoSerialNum <s/n>
onecli config set SYSTEM_PROD_DATA.SysEncloseAssetTag <asset_tag>

- Online KCS access (unauthenticated and user restricted): You do not need to specify a value for access_method when you use this access method.

**Note:** The KCS access method uses the IPMI/KCS interface, which requires that the IPMI driver be installed.

The following commands are examples of not using the user ID and password default values:

onecli config set SYSTEM_PROD_DATA.SysInfoProdName <m/t_model>
onecli config set SYSTEM_PROD_DATA.SysInfoSerialNum <s/n>
onecli config set SYSTEM_PROD_DATA.SysEncloseAssetTag <asset_tag>

- Remote LAN access, type the command:

**Note:** When using the remote LAN/WAN access method to access Lenovo XClarity Controller from a client, the host and the xcc_external_ip address are required parameters.

[--imm xcc_user_id:xcc_password@xcc_external_ip]
or

[--bmc xcc_user_id:xcc_password@xcc_external_ip]

Where:

**xcc_external_ip**
The BMC/IMM/XCC IP address. There is no default value. This parameter is required.

**xcc_user_id**
The BMC/IMM/XCC account (1 of 12 accounts). The default value is USERID.

**xcc_password**
The BMC/IMM/XCC account password (1 of 12 accounts). The default value is PASSWORD (with a zero 0 not an O).

Note: BMC, IMM, or XCC internal LAN/USB IP address, account name, and password are all valid for this command.

Examples that do use the user ID and password default values:
onecli config set SYSTEM_PROD_DATA.SysInfoProdName <m/t_model> --host <xcc_ip>
onecli config set SYSTEM_PROD_DATA.SysInfoSerialNum <s/n> --host <xcc_ip>
onecli config set SYSTEM_PROD_DATA.SysEncloseAssetTag <asset_tag> --host <xcc_ip>

Enable TPM/TCM

The server supports Trusted Platform Module (TPM), Version 1.2 or Version 2.0.

Note: For customers in Chinese Mainland, integrated TPM is not supported. However, customers in Chinese Mainland can install a Trusted Cryptographic Module (TCM) adapter or a TPM adapter (sometimes called a daughter card).

When a system board is replaced, you must make sure that the TPM/TCM policy is set correctly.

CAUTION:
Take special care when setting the TPM/TCM policy. If it is not set correctly, the system board can become unusable.

Set the TPM/TCM policy

By default, a replacement system board is shipped with the TPM/TCM policy set to undefined. You must modify this setting to match the setting that was in place for the system board that is being replaced.

You can set the TPM/TCM policy from Lenovo XClarity Provisioning Manager.

Complete the following steps to set the TPM/TCM policy.

Step 1. Start the server and when prompted, press F1 to display Lenovo XClarity Provisioning Manager.

Step 2. If the power-on Administrator password is required, enter the password.

Step 3. From the System Summary page, click Update VPD.

Step 4. Set the policy to one of the following settings.

- **TCM enabled - China only.** Customers in Chinese Mainland should choose this setting if a TCM adapter is installed.
- **NationZ TPM 2.0 enabled - China only.** Customers in Chinese Mainland should choose this setting if a NationZ TPM 2.0 adapter is installed.
- **TPM enabled - ROW.** Customers outside of Chinese Mainland should choose this setting.
- **Permanently disabled.** Customers in Chinese Mainland should use this setting if no TPM or TCM adapter is installed.

Although the setting undefined is available as a policy setting, it should not be used.
Notes: You can use Lenovo XClarity Essentials OneCLI to update the TPM/TCM policy. Please note that a Local IPMI user and password must be setup in Lenovo XClarity Controller for remote accessing to the target system.

1. Read TpmTcmPolicyLock to check whether the TPM_TCM_POLICY has been locked:
   OneCli.exe config show imm.TpmTcmPolicyLock --override --imm <userid>:<password>@<ip_address>

   Note: The imm.TpmTcmPolicyLock value must be 'Disabled', which means TPM_TCM_POLICY is NOT locked and changes to the TPM_TCM_POLICY are permitted. If the return code is 'Enabled' then no changes to the policy are permitted. The planar may still be used if the desired setting is correct for the system being replaced.

2. Configure the TPM_TCM_POLICY into XCC:
   • For the customer in Chinese Mainland with no TCM:
     OneCli.exe config set imm.TpmTcmPolicy "NeitherTpmNorTcm" --override --imm <userid>:<password>@<ip_address>
   • For the customer in Chinese Mainland that has installed TCM module on the original system
     (TCM module should be moved to the FRU prior to changing policy)
     OneCli.exe config set imm.TpmTcmPolicy "TcmOnly" --override --imm <userid>:<password>@<ip_address>
   • For the customer outside of Chinese Mainland:
     OneCli.exe config set imm.TpmTcmPolicy "TpmOnly" --override --imm <userid>:<password>@<ip_address>

3. Issue reset command to reset system:
   OneCli.exe misc ospower reboot --imm <userid>:<password>@<ip_address>

4. Read back the value to check whether the change has been accepted:
   OneCli.exe config show imm.TpmTcmPolicy --override --imm <userid>:<password>@<ip_address>

   Notes:
   • If the read back value is matched it means the TPM_TCM_POLICY has been set correctly.
     imm.TpmTcmPolicy is defined as below:
     - Value 0 use string "Undefined", which means UNDEFINED policy.
     - Value 1 use string "NeitherTpmNorTcm", which means TPM_PERM_DISABLED.
     - Value 2 use string "TpmOnly", which means TPM_ALLOWED.
     - Value 4 use string "TcmOnly", which means TCM_ALLOWED.
   • Below 4 steps must also be used to 'lock' the TPM_TCM_POLICY when using OneCli/ASU commands:

5. Read TpmTcmPolicyLock to check whether the TPM_TCM_POLICY has been locked, command as below:
   OneCli.exe config show imm.TpmTcmPolicyLock --override --imm <userid>:<password>@<ip_address>

   The value must be 'Disabled', it means TPM_TCM_POLICY is NOT locked and must be set.

6. Lock the TPM_TCM_POLICY:
   OneCli.exe config set imm.TpmTcmPolicyLock "Enabled" --override --imm <userid>:<password>@<ip_address>

7. Issue reset command to reset system, command as below:
   OneCli.exe misc ospower reboot --imm <userid>:<password>@<ip_address>

   During the reset, UEFI will read the value from imm.TpmTcmPolicyLock, if the value is 'Enabled' and the imm.TpmTcmPolicy value is invalid, UEFI will lock the TPM_TCM_POLICY setting.

   The valid value for imm.TpmTcmPolicy includes 'NeitherTpmNorTcm', 'TpmOnly' and 'TpmOnly'.
If the `imm.TpmTcmPolicy` is set as 'Enabled' but `imm.TpmTcmPolicy` value is invalid, UEFI will reject the 'lock' request and change `imm.TpmTcmPolicy` back to 'Disabled'.

8. Read back the value to check whether the ‘Lock’ is accepted or rejected. command as below:

   OneCli.exe config show imm.TpmTcmPolicy --override --imm <userid>:<password>@<ip_address>

   **Note:** If the read back value is changed from 'Disabled' to 'Enabled' that means the TPM_TCM_POLICY has been locked successfully. There is no method to unlock a policy once it has been set other than replacing system board.

   `imm.TpmTcmPolicyLock` is defined as below:

   Value 1 use string “Enabled”, which means lock the policy. Other values are not accepted.

   Procedure also requires that Physical Presence is enabled. The Default value for FRU will be enabled.

   `PhysicalPresencePolicyConfiguration.PhysicalPresencePolicy=Enable`

**Assert Physical Presence**

Before you can assert Physical Presence, the Physical Presence Policy must be enabled. By default, the Physical Presence Policy is enabled with a timeout of 30 minutes.

If the Physical Presence Policy is enabled, you can assert Physical Presence through the Lenovo XClarity Controller or through hardware jumpers on the system board.

**Notes:** If the Physical Presence Policy has been disabled:

1. Set the hardware Physical Presence jumper on the system board to assert Physical Presence.
2. Enable the Physical Presence Policy using either F1 (UEFI Settings) or Lenovo XClarity Essentials OneCLI.

**Assert Physical Presence through the Lenovo XClarity Controller**

Complete the following steps to assert Physical Presence through the Lenovo XClarity Controller:

1. Log in to the Lenovo XClarity Controller interface.
   
   For information about logging in to the Lenovo XClarity Controller, see: [http://sysmgmt.lenovofiles.com/help/topic/com.lenovo.systems.management.xcc.doc/dw1lm_c_chapter2_openingandusing.html](http://sysmgmt.lenovofiles.com/help/topic/com.lenovo.systems.management.xcc.doc/dw1lm_c_chapter2_openingandusing.html)

2. Click **BMC Configuration ➔ Security** and verify that Physical Presence is set to **assert**.

**Assert Physical Presence through the hardware**

You can also assert hardware Physical Presence through the use of a jumper on the system board. For more information about asserting hardware Physical Presence through the use of a jumper, see “System board switches and jumpers” on page 25

**Set the TPM version**

To be able to set the TPM version, Physical Presence must be asserted.

The Lenovo XClarity Provisioning Manager or the Lenovo XClarity Essentials OneCLI can be used to set the TPM version.

To set the TPM version:

1. Download and install Lenovo XClarity Essentials OneCLI.
   a. Go to [http://datacentersupport.lenovo.com](http://datacentersupport.lenovo.com) and navigate to the support page for your server.
b. Click **Drivers & Software**.

c. Navigate to the version of Lenovo XClarity Essentials OneCLI for your operating system and download the package.

2. Run the following command to set the TPM version:

   **Note:** You can change the TPM version from 1.2 to 2.0 and back again. However, you can toggle between versions a maximum of 128 times.

   **To set the TPM version to version 2.0:**
   ```
   OneCli.exe config set TrustedComputingGroup.DeviceOperation "Update to TPM2.0 compliant" --bmc userid:password@ip_address
   ```

   **To set the TPM version to version 1.2:**
   ```
   OneCli.exe config set TrustedComputingGroup.DeviceOperation "Update to TPM1.2 compliant" --bmc userid:password@ip_address
   ```

   where:
   - `<userid>`: `<password>` are the credentials used to access the BMC (Lenovo XClarity Controller interface) of your server. The default user ID is USERID, and the default password is PASSW0RD (zero, not an uppercase o)
   - `<ip_address>` is the IP address of the BMC.

   For more information about the Lenovo XClarity Essentials OneCLI `set` command, see:

3. Alternatively, you can use the following Advanced Settings Utility (ASU) commands:

   **To set the TPM version to version 2.0:**
   ```
   asu64 set TPMVersion.TPMVersion "Update to TPM2.0 compliant" --host <ip_address> --user <userid> --password <password> --override
   ```

   **To set the TPM version to version 1.2:**
   ```
   asu64 set TPMVersion.TPMVersion "Update to TPM1.2 compliant" --host <ip_address> --user <userid> --password <password> --override
   ```

   where:
   - `<userid>` and `<password>` are the credentials used to the BMC (Lenovo XClarity Controller interface) of your server. The default user ID is USERID, and the default password is PASSW0RD (zero, not an uppercase o)
   - `<ip_address>` is the IP address of the BMC.

**Enable UEFI Secure Boot**

Optionally, you can enable UEFI Secure Boot.

Physical Presence must be asserted if you are going to enable UEFI Secure Boot. See “Assert Physical Presence” on page 141.

For information about accessing the Lenovo XClarity Controller interface, see:

There are two methods available to enable UEFI Secure Boot:

- **From Lenovo XClarity Provisioning Manager**

  To enable UEFI Secure Boot from Lenovo XClarity Provisioning Manager:
1. Start the server and when prompted, press F1 to display Lenovo XClarity Provisioning Manager.
2. If the power-on Administrator password is required, enter the password.
3. From the UEFI Setup page, click System Settings → Security → Secure Boot.
4. Enable Secure Boot and save the settings.

- From Lenovo XClarity Essentials OneCLI

To enable UEFI Secure Boot from Lenovo XClarity Essentials OneCLI:
1. Download and install Lenovo XClarity Essentials OneCLI.
2. Run the following command to enable Secure Boot:

```
OneCli.exe config set SecureBootConfiguration.SecureBootSetting Enabled --override --bmc <userid>:<password>@<ip_address>
```

where:
- `<userid>:<password>` are the credentials used to access the BMC (Lenovo XClarity Controller interface) of your server. The default user ID is USERID, and the default password is PASSW0RD (zero, not an uppercase o)
- `<ip_address>` is the IP address of the BMC.

For more information about the Lenovo XClarity Essentials OneCLI `set` command, see:

`http://sysmgt.lenovofiles.com/help/topic/toolsctr_cli_lenovo/onecli_r_set_command.html`

**Complete the parts replacement**

Use this information to complete the parts replacement.

To complete the parts replacement, do the following:
1. Ensure that all components have been reassembled correctly and that no tools or loose screws are left inside your server.
2. Properly route and secure the cables in the server. See “Internal cable routing” on page 28.
3. If you have removed the top cover, reinstall it. See “Install the top cover” on page 54.
4. Reconnect external cables and power cords to the server.

**Attention:** To avoid component damage, connect the power cords last.

5. Update the server configuration if necessary.
- Download and install the latest device drivers: `http://datacentersupport.lenovo.com`
- Update the system firmware. See “Firmware updates” on page 7.
- Use the Lenovo XClarity Provisioning Manager to update the UEFI configuration. For more information, see:
- Use the Lenovo XClarity Provisioning Manager to configure the RAID if you have installed or removed a hot-swap drive, a RAID adapter, or the M.2 backplane and M.2 drive. For more information, see:

**Note:** Make sure the latest version of ThinkSystem M.2 with Mirroring Enablement Kit Firmware is applied to avoid virtual disk/array missing after system board replacement.
Chapter 4. Problem determination

Use the information in this section to isolate and resolve issues that you might encounter while using your server.

Lenovo servers can be configured to automatically notify Lenovo Support if certain events are generated. You can configure automatic notification, also known as Call Home, from management applications, such as the Lenovo XClarity Administrator. If you configure automatic problem notification, Lenovo Support is automatically alerted whenever a server encounters a potentially significant event.

To isolate a problem, you should typically begin with the event log of the application that is managing the server:

• If you are managing the server from the Lenovo XClarity Administrator, begin with the Lenovo XClarity Administrator event log.
• If you are managing the server from the Chassis Management Module 2, begin with the Chassis Management Module 2 event log.
• If you are using some other management application, begin with the Lenovo XClarity Controller event log.

Event logs

An alert is a message or other indication that signals an event or an impending event. Alerts are generated by the Lenovo XClarity Controller or by UEFI in the servers. These alerts are stored in the Lenovo XClarity Controller Event Log. If the server is managed by the Chassis Management Module 2 or by the Lenovo XClarity Administrator, alerts are automatically forwarded to those management applications.

Note: For a listing of events, including user actions that might need to be performed to recover from an event, see the Messages and Codes Reference, which is available at: http://thinksystem.lenovofiles.com/help/topic/7X07/pdf_files.html

Lenovo XClarity Administrator event log

If you are using Lenovo XClarity Administrator to manage server, network, and storage hardware, you can view the events from all managed devices through the XClarity Administrator.
Log

Figure 100. Lenovo XClarity Administrator event log

For more information about working with events from XClarity Administrator, see:

Lenovo XClarity Controller event log

The Lenovo XClarity Controller monitors the physical state of the server and its components using sensors that measure internal physical variables such as temperature, power-supply voltages, fan speeds, and component status. The Lenovo XClarity Controller provides various interfaces to systems management software and to system administrators and users to enable remote management and control of a server.

The Lenovo XClarity Controller monitors all components of the server and posts events in the Lenovo XClarity Controller event log.

Figure 101. Lenovo XClarity Controller event log

For more information about accessing the Lenovo XClarity Controller event log, see:
General problem determination procedures

Use the information in this section to resolve problems if the event log does not contain specific errors or the server is inoperative.

If you are not sure about the cause of a problem and the power supplies are working correctly, complete the following steps to attempt to resolve the problem:

1. Turn off the server.
2. Ensure that the server is cabled correctly.
3. Remove or disconnect the following devices, one at a time, until you find the failure. Turn on and configure the server each time you remove or disconnect a device.
   - Any external devices
   - Surge-suppressor device (on the server)
   - Printer, mouse, and non-Lenovo devices
   - Each adapter
   - Storage drives
   - DIMMs until you reach the minimum configuration that is supported for the server

   **Note:** For minimal configuration for debugging, see “Specifications” on page 2
4. Turn on the server.

If the problem is solved when you remove an adapter from the server, but the problem recurs when you install the same adapter again, suspect the adapter. If the problem recurs when you replace the adapter with a different one, try a different PCIe slot.

If the problem appears to be a networking problem and the server passes all system tests, suspect a network cabling problem that is external to the server.

Resolving suspected power problems

Power problems can be difficult to solve. For example, a short circuit can exist anywhere on any of the power distribution buses. Usually, a short circuit will cause the power subsystem to shut down because of an overcurrent condition.

Complete the following steps to diagnose and resolve a suspected power problem.

Step 1. Check the event log and resolve any errors related to the power.

   **Note:** Start with the event log of the application that is managing the server. For more information about event logs, see “Event logs” on page 145.

Step 2. Check for short circuits, for example, if a loose screw is causing a short circuit on a circuit board.

Step 3. Remove the adapters and disconnect the cables and power cords to all internal and external devices until the server is at the minimum configuration that is required for the server to start. See “Specifications” on page 2 to determine the minimum configuration for your server.

Step 4. Reconnect all ac power cords and turn on the server. If the server starts successfully, reseat the adapters and devices one at a time until the problem is isolated.

If the server does not start from the minimum configuration, replace the components in the minimum configuration one at a time until the problem is isolated.
Resolving suspected Ethernet controller problems

The method that you use to test the Ethernet controller depends on which operating system you are using. See the operating-system documentation for information about Ethernet controllers, and see the Ethernet controller device-driver readme file.

Complete the following steps to attempt to resolve suspected problems with the Ethernet controller.

Step 1. Make sure that the correct device drivers, which come with the server are installed and that they are at the latest level.

Step 2. Make sure that the Ethernet cable is installed correctly.

- The cable must be securely attached at all connections. If the cable is attached but the problem remains, try a different cable.
- If you set the Ethernet controller to operate at 100 Mbps or 1000 Mbps, you must use Category 5 cabling.

Step 3. Determine whether the hub supports auto-negotiation. If it does not, try configuring the integrated Ethernet controller manually to match the speed and duplex mode of the hub.

Step 4. Check the Ethernet controller LEDs on the rear panel of the server. These LEDs indicate whether there is a problem with the connector, cable, or hub.

- The Ethernet link status LED is lit when the Ethernet controller receives a link pulse from the hub. If the LED is off, there might be a defective connector or cable or a problem with the hub.
- The Ethernet transmit/receive activity LED is lit when the Ethernet controller sends or receives data over the Ethernet network. If the Ethernet transmit/receive activity is off, make sure that the hub and network are operating and that the correct device drivers are installed.

Step 5. Check the LAN activity LED on the rear of the server. The LAN activity LED is lit when data is active on the Ethernet network. If the LAN activity LED is off, make sure that the hub and network are operating and that the correct device drivers are installed.

Step 6. Check for operating-system-specific causes of the problem, and also make sure that the operating system drivers are installed correctly.

Step 7. Make sure that the device drivers on the client and server are using the same protocol.

If the Ethernet controller still cannot connect to the network but the hardware appears to be working, the network administrator must investigate other possible causes of the error.

Troubleshooting by symptom

Use this information to find solutions to problems that have identifiable symptoms.

To use the symptom-based troubleshooting information in this section, complete the following steps:

1. Check the event log of the application that is managing the server and follow the suggested actions to resolve any event codes.
   - If you are managing the server from the Lenovo XClarity Administrator, begin with the Lenovo XClarity Administrator event log.
   - If you are using some other management application, begin with the Lenovo XClarity Controller event log.

   For more information about event logs, see “Event logs” on page 145.

2. Review this section to find the symptoms that you are experiencing and follow the suggested actions to resolve the issue.

3. If the problem persists, contact support (see “Contacting Support” on page 165).
Power on and power off problems

Use this information to resolve issues when powering on or powering off the server.

- “Embedded hypervisor is not in the boot list” on page 149
- “The power button does not work (server does not start)” on page 149
- “Server does not power on” on page 150
- “Server does not power off” on page 150

Embedded hypervisor is not in the boot list

Complete the following steps until the problem is solved.

1. If the server has been installed, moved, or serviced recently, or if this is the first time the embedded hypervisor is being used, make sure that the device is connected properly and that there is no physical damage to the connectors.
2. See the documentation that comes with the optional embedded hypervisor flash device for setup and configuration information.
4. Make sure that the embedded hypervisor device is listed in the list of available boot options. From the management controller user interface, click **Server Configuration ➔ Boot Options**.
   For information about accessing the management controller user interface, see the XClarity Controller product documentation: [http://sysmgmt.lenovofiles.com/help/topic/com.lenovo.systems.management.xcc.doc/dw1lm_c_chapter2_openingandusing.html](http://sysmgmt.lenovofiles.com/help/topic/com.lenovo.systems.management.xcc.doc/dw1lm_c_chapter2_openingandusing.html)
5. Check [http://datacentersupport.lenovo.com](http://datacentersupport.lenovo.com) for any tech tips (service bulletins) related to the embedded hypervisor and the server.
6. Make sure that other software works on the server to ensure that it is working properly.

The power button does not work (server does not start)

**Note:** The power button will not function until approximately 1 to 3 minutes after the server has been connected to ac power.

Complete the following steps until the problem is resolved:

1. Make sure that the power button on the server is working correctly:
   a. Disconnect the server power cords.
   b. Reconnect the server power cords.
   c. Reseat the operator information panel cable, and then repeat steps a and b.
      - If the server starts, reseat the operator information panel.
      - If the problem remains, replace the operator information panel.
2. Make sure that:
   - The power cords are correctly connected to the server and to a working electrical outlet.
   - The LEDs on the power supply do not indicate a problem.
3. Reseat the power supplies.
4. Replace each power supply, restarting the server each time:
   - DIMMs
• Power supplies

5. If you just installed an optional device, remove it, and restart the server. If the server starts, you might have installed more devices than the power supply supports.

Server does not power on
Complete the following steps until the problem is resolved:
1. Check the event log for any events related to the server not powering on.
2. Check for any LEDs that are flashing amber.
3. Check the power LED on the system board.
4. Reseat the power supply.
5. Replace the power supply.

Server does not power off
Complete the following steps until the problem is resolved:
1. Determine whether you are using an Advanced Configuration and Power Interface (ACPI) or a non-ACPI operating system. If you are using a non-ACPI operating system, complete the following steps:
   a. Press Ctrl+Alt+Delete.
   b. Turn off the server by pressing the power button and holding it down for 5 seconds.
   c. Restart the server.
   d. If the server fails POST and the power button does not work, disconnect the power cord for 20 seconds; then, reconnect the power cord and restart the server.
2. If the problem remains or if you are using an ACPI-aware operating system, suspect the system board.

Memory problems
Use this information to resolve issues related to memory.
• “Displayed system memory less than installed physical memory” on page 150
• “Multiple rows of DIMMs in a branch identified as failing” on page 151

Displayed system memory less than installed physical memory
Complete the following steps until the problem is resolved:

Note: Each time you install or remove a DIMM, you must disconnect the server from the power source; then, wait 10 seconds before restarting the server.
1. Make sure that:
   • No error LEDs are lit on the operator information panel.
   • Memory mirrored channel does not account for the discrepancy.
   • The DIMMs are seated correctly.
   • You have installed the correct type of DIMMs.
   • If you changed the DIMMs, you updated the memory configuration in the Setup utility.
   • All banks of memory are enabled. The server might have automatically disabled a memory bank when it detected a problem, or a memory bank might have been manually disabled.
   • There is no memory mismatch when the server is at the minimum memory configuration.
2. Reseat the DIMMs, and then restart the server.
3. Run memory diagnostics. When you start a server and press F1, the Lenovo XClarity Provisioning Manager interface is displayed by default. You can perform memory diagnostics from this interface. From the Diagnostic page, click **Run Diagnostic → Memory test**.

4. Check the POST error log:
   - If a DIMM was disabled by a systems-management interrupt (SMI), replace the DIMM.
   - If a DIMM was disabled by the user or by POST, reseat the DIMM; then, run the Setup utility and enable the DIMM.

5. Reseat the DIMM.

6. Restart the server.

**Multiple rows of DIMMs in a branch identified as failing**

1. Reseat the DIMMs; then, restart the server.

2. Remove the lowest-numbered DIMM pair of those that are identified and replace it with an identical known good DIMM; then, restart the server. Repeat as necessary. If the failures continue after all identified DIMMs are replaced, go to step 4.

3. Return the removed DIMMs, one at a time, to their original connectors, restarting the server after each DIMM, until a DIMM fails. Replace each failing DIMM with an identical known good DIMM, restarting the server after each DIMM replacement. Repeat step 3 until you have tested all removed DIMMs.

4. Replace the lowest-numbered DIMM of those identified; then, restart the server. Repeat as necessary.

5. Reverse the DIMMs between the channels (of the same processor), and then restart the server. If the problem is related to a DIMM, replace the failing DIMM.

6. (Trained technician only) Replace the system board.

---

**Hard disk drive problems**

Use this information to resolve issues related to the hard disk drives.

- “Server cannot recognize a hard drive” on page 151
- “Multiple hard drives fail” on page 152
- “Multiple hard drives are offline” on page 152
- “A replacement hard disk drive does not rebuild” on page 152
- “Green hard disk drive activity LED does not represent actual state of associated drive” on page 153
- “Yellow hard disk drive status LED does not represent actual state of associated drive” on page 153

**Server cannot recognize a hard drive**

Complete the following steps until the problem is solved.

1. Observe the associated yellow hard disk drive status LED. If the LED is lit, it indicates a drive fault.

2. If the LED is lit, remove the drive from the bay, wait 45 seconds, and reinsert the drive, making sure that the drive assembly connects to the hard disk drive backplane.

3. Observe the associated green hard disk drive activity LED and the yellow status LED:
   - If the green activity LED is flashing and the yellow status LED is not lit, the drive is recognized by the controller and is working correctly. Run the diagnostics tests for the hard disk drives. When you start a server and press F1, the Lenovo XClarity Provisioning Manager interface is displayed by default. You can perform hard drive diagnostics from this interface. From the Diagnostic page, click **Run Diagnostic → HDD test**.
   - If the green activity LED is flashing and the yellow status LED is flashing slowly, the drive is recognized by the controller and is rebuilding.
• If neither LED is lit or flashing, check the hard disk drive backplane.
• If the green activity LED is flashing and the yellow status LED is lit, replace the drive. If the activity of the LEDs remains the same, go to step Hard disk drive problems. If the activity of the LEDs changes, return to step 1.

4. Make sure that the hard disk drive backplane is correctly seated. When it is correctly seated, the drive assemblies correctly connect to the backplane without bowing or causing movement of the backplane.

5. Reseat the backplane power cable and repeat steps 1 through 3.

6. Reseat the backplane signal cable and repeat steps 1 through 3.

7. Suspect the backplane signal cable or the backplane:
   • Replace the affected backplane signal cable.
   • Replace the affected backplane.

8. Run the diagnostics tests for the hard disk drives. When you start a server and press F1, the Lenovo XClarity Provisioning Manager interface is displayed by default. You can perform hard drive diagnostics from this interface. From the Diagnostic page, click Run Diagnostic ➔ HDD test.

   Based on those tests:
   • If the adapter passes the test but the drives are not recognized, replace the backplane signal cable and run the tests again.
   • Replace the backplane.
   • If the adapter fails the test, disconnect the backplane signal cable from the adapter and run the tests again.
   • If the adapter fails the test, replace the adapter.

Multiple hard drives fail
Complete the following steps until the problem is solved:
• View the Lenovo XClarity Controller event log for events related to power supplies or vibration issues and resolve those events.
• Make sure that the device drivers and firmware for the hard disk drive and server are at the latest level

Important: Some cluster solutions require specific code levels or coordinated code updates. If the device is part of a cluster solution, verify that the latest level of code is supported for the cluster solution before you update the code.

Multiple hard drives are offline
Complete the following steps until the problem is solved:
• View the Lenovo XClarity Controller event log for events related to power supplies or vibration issues and resolve those events.
• View the storage subsystem log for events related to the storage subsystem and resolve those events.

A replacement hard disk drive does not rebuild
Complete the following steps until the problem is solved:
1. Make sure that the hard disk drive is recognized by the adapter (the green hard disk drive activity LED is flashing).
2. Review the SAS/SATA RAID adapter documentation to determine the correct configuration parameters and settings.
Green hard disk drive activity LED does not represent actual state of associated drive

Complete the following steps until the problem is solved:

1. If the green hard disk drive activity LED does not flash when the drive is in use, run the diagnostics tests for the hard disk drives. When you start a server and press F1, the Lenovo XClarity Provisioning Manager interface is displayed by default. You can perform hard drive diagnostics from this interface. From the Diagnostic page, click Run Diagnostic → HDD test.

2. If the drive passes the test, replace the backplane.

3. If the drive fails the test, replace the drive.

Yellow hard disk drive status LED does not represent actual state of associated drive

Complete the following steps until the problem is solved:

1. Turn off the server.

2. Reseat the SAS/SATA adapter.

3. Reseat the backplane signal cable and backplane power cable.

4. Reseat the hard disk drive.

5. Power on the server and observe the activity of the hard disk drive LEDs.

Monitor and video problems

Use this information to solve problems related to a monitor or video.

- “Incorrect characters are displayed” on page 153
- “Screen is blank” on page 153
- “Screen goes blank when you start some application programs” on page 154
- “The monitor has screen jitter, or the screen image is wavy, unreadable, rolling, or distorted.” on page 154
- “The wrong characters appear on the screen” on page 154

Incorrect characters are displayed

Complete the following steps:

1. Verify that the language and locality settings are correct for the keyboard and operating system.

2. If the wrong language is displayed, update the server firmware to the latest level. See “Firmware updates” on page 7.

Screen is blank

1. If the server is attached to a KVM switch, bypass the KVM switch to eliminate it as a possible cause of the problem: connect the monitor cable directly to the correct connector on the rear of the server.

2. The management controller remote presence function is disabled if you install an optional video adapter. To use the management controller remote presence function, remove the optional video adapter.

3. If the server installed with the graphical adapters while turning on the server, the Lenovo logo displays on the screen after approximately 3 minutes. This is normal operation while the system loads.

4. Make sure that:
   - The server is turned on. If there is no power to the server.
   - The monitor cables are connected correctly.
   - The monitor is turned on and the brightness and contrast controls are adjusted correctly.

5. Make sure that the correct server is controlling the monitor, if applicable.

6. Make sure that corrupted server firmware is not affecting the video; see “Firmware updates” on page 7.

7. Observe the LEDs on the system board; if the codes are changing, go to step 6.
8. Replace the following components one at a time, in the order shown, restarting the server each time:
   a. Monitor
   b. Video adapter (if one is installed)
   c. (Trained technician only) System board

**Screen goes blank when you start some application programs**

1. Make sure that:
   - The application program is not setting a display mode that is higher than the capability of the monitor.
   - You installed the necessary device drivers for the application.

**The monitor has screen jitter, or the screen image is wavy, unreadable, rolling, or distorted.**

1. If the monitor self-tests show that the monitor is working correctly, consider the location of the monitor. Magnetic fields around other devices (such as transformers, appliances, fluorescents, and other monitors) can cause screen jitter or wavy, unreadable, rolling, or distorted screen images. If this happens, turn off the monitor.

   **Attention:** Moving a color monitor while it is turned on might cause screen discoloration.

   Move the device and the monitor at least 305 mm (12 in.) apart, and turn on the monitor.

   **Notes:**
   a. To prevent diskette drive read/write errors, make sure that the distance between the monitor and any external diskette drive is at least 76 mm (3 in.).
   b. Non-Lenovo monitor cables might cause unpredictable problems.

2. Reseat the monitor cable.

3. Replace the components listed in step 2 one at a time, in the order shown, restarting the server each time:
   a. Monitor cable
   b. Video adapter (if one is installed)
   c. Monitor
   d. (Trained technician only) System board

**The wrong characters appear on the screen**

Complete the following steps until the problem is solved:

1. Verify that the language and locality settings are correct for the keyboard and operating system.

2. If the wrong language is displayed, update the server firmware to the latest level. See “Firmware updates” on page 7.

**Keyboard, mouse, or USB-device problems**

Use this information to solve problems related to a keyboard, mouse, or USB device.

- “All or some keys on the keyboard do not work.” on page 154
- “Mouse does not work.” on page 155
- “USB-device does not work.” on page 155

**All or some keys on the keyboard do not work.**

1. Make sure that:
The keyboard cable is securely connected.
The server and the monitor are turned on.
2. If you are using a USB keyboard, run the Setup utility and enable keyboardless operation.
3. If you are using a USB keyboard and it is connected to a USB hub, disconnect the keyboard from the hub and connect it directly to the server.
4. Replace the keyboard.

Mouse does not work.
1. Make sure that:
   • The mouse cable is securely connected to the server.
   • The mouse device drivers are installed correctly.
   • The server and the monitor are turned on.
   • The mouse option is enabled in the Setup utility.
2. If you are using a USB mouse and it is connected to a USB hub, disconnect the mouse from the hub and connect it directly to the server.
3. Replace the mouse.

USB-device does not work.
1. Make sure that:
   • The correct USB device driver is installed.
   • The operating system supports USB devices.
2. Make sure that the USB configuration options are set correctly in system setup.
   Restart the server and press F1 to display the Lenovo XClarity Provisioning Manager system setup interface. Then, click System Settings ➞ Devices and I/O Ports ➞ USB Configuration.
3. If you are using a USB hub, disconnect the USB device from the hub and connect it directly to the server.

Optional-device problems
Use this information to solve problems related to optional devices.

• “External USB device not recognized” on page 155
• “PCIe adapter is not recognized or is not functioning” on page 155
• “A Lenovo optional device that worked previously does not work now.” on page 156
• “A Lenovo optional device that was just installed does not work.” on page 156
• “A Lenovo optional device that worked previously does not work now.” on page 156

External USB device not recognized
Complete the following steps until the problem is resolved:
1. Make sure that the proper drivers are installed on the compute node. See the product documentation for the USB device for information about device drivers.
2. Use the Setup utility to make sure that the device is configured correctly.
3. If the USB device is plugged into a hub or the console breakout cable, unplug the device and plug it directly into the USB port on the front of the compute node.

PCIe adapter is not recognized or is not functioning
Complete the following steps until the problem is resolved:
1. Check the event log and resolve any issues related to the device.
2. Validate that the device is supported for the server (see http://www.lenovo.com/us/en/serverproven/).
3. Make sure that the adapter is installed in a correct slot.
4. Make sure that the proper device drivers are installed for the device.
5. Resolve any resource conflicts if running legacy mode (UEFI).
6. Check http://datacentersupport.lenovo.com for any tech tips (also known as retain tips or service bulletins) that might be related to the adapter.
7. Ensure any adapter external connections are correct and that the connectors are not physically damaged.

**Insufficient PCIe resources are detected.**

If you see an error message stating "Insufficient PCI Resources Detected," complete the following steps until the problem is resolved:

1. Remove one of the PCIe adapters.
2. Restart the system and press F1 to display the Lenovo XClarity Provisioning Manager system setup interface.
3. Click **UEFI Setup ➔ System Settings ➔ Devices and I/O Ports ➔ MM Config Base**; then, modify the setting to the lower memory capacity. For example, modify 3 GB to 2 GB or modify 2 GB to 1 GB.
4. Save the settings and restart the system.
5. The action for this step will differ based on whether or not the reboot is successful.
   - If the reboot is successful, shut down the solution and reinstall the PCIe card you removed.
   - If the reboot failed, repeat step 2 to step 5.

**A Lenovo optional device that was just installed does not work.**

1. Make sure that:
   - The device is supported for the server (see http://www.lenovo.com/us/en/serverproven/).
   - You followed the installation instructions that came with the device and the device is installed correctly.
   - You have not loosened any other installed devices or cables.
   - You updated the configuration information in system setup. Whenever memory or any other device is changed, you must update the configuration.
2. Reseat the device that you just installed.
3. Replace the device that you just installed.

**A Lenovo optional device that worked previously does not work now.**

1. Make sure that all of the cable connections for the device are secure.
2. If the device comes with test instructions, use those instructions to test the device.
3. If the failing device is a SCSI device, make sure that:
   - The cables for all external SCSI devices are connected correctly.
   - The last device in each SCSI chain, or the end of the SCSI cable, is terminated correctly.
   - Any external SCSI device is turned on. You must turn on an external SCSI device before you turn on the server.
4. Reseat the failing device.
5. Replace the failing device.
Serial-device problems

Use this information to solve problems with serial ports or devices.

- “Number of displayed serial ports is less than the number of installed serial ports” on page 157
- “Serial device does not work” on page 157

**Number of displayed serial ports is less than the number of installed serial ports**

Complete the following steps until the problem is solved.

1. Make sure that:
   - Each port is assigned a unique address in the Setup utility and none of the serial ports is disabled.
   - The serial-port adapter (if one is present) is seated correctly
2. Reseat the serial port adapter.
3. Replace the serial port adapter.

**Serial device does not work**

1. Make sure that:
   - The device is compatible with the server.
   - The serial port is enabled and is assigned a unique address.
   - The device is connected to the correct connector.
2. Reseat the following components:
   a. Failing serial device.
   b. Serial cable.
3. Replace the following components:
   a. Failing serial device.
   b. Serial cable.
4. (Trained technician only) Replace the system board.

Intermittent problems

Use this information to solve intermittent problems.

- “Intermittent external device problems” on page 157
- “Intermittent KVM problems” on page 158
- “Intermittent unexpected reboots” on page 158

**Intermittent external device problems**

Complete the following steps until the problem is solved.

1. Make sure that the correct device drivers are installed. See the manufacturer’s website for documentation.
2. For a USB device:
   a. Make sure that the device is configured correctly.
      
      Restart the server and press F1 to display the Lenovo XClarity Provisioning Manager system setup interface. Then, click **System Settings ➔ Devices and I/O Ports ➔ USB Configuration**.
   b. Connect the device to another port. If using a USB hub, remove the hub and connect the device directly to the compute node. Make sure that the device is configured correctly for the port.
**Intermittent KVM problems**

Complete the following steps until the problem is solved.

**Video problems:**

1. Make sure that all cables and the console breakout cable are properly connected and secure.
2. Make sure that the monitor is working properly by testing it on another compute node.
3. Test the console breakout cable on a working compute node to ensure that it is operating properly. Replace the console breakout cable if it is defective.

**Keyboard problems:**

Make sure that all cables and the console breakout cable are properly connected and secure.

**Mouse problems:**

Make sure that all cables and the console breakout cable are properly connected and secure.

**Intermittent unexpected reboots**

**Note:** Some correctable errors require that the server reboot so that it can disable a device, such as a memory DIMM or a processor to allow the machine to boot up properly.

1. If the reset occurs during POST and the POST watchdog timer is enabled, make sure that sufficient time is allowed in the watchdog timeout value (POST Watchdog Timer).
   
   To check the POST watchdog time, restart the server and press F1 to display the Lenovo XClarity Provisioning Manager system setup interface. Then, click **BMC Settings ➔ POST Watchdog Timer**.

2. If the reset occurs after the operating system starts, disable any automatic server restart (ASR) utilities, such as the Automatic Server Restart IPMI Application for Windows, or any ASR devices that are installed.

3. See the management controller event log to check for an event code that indicates a reboot. See “Event logs” on page 145 for information about viewing the event log.

**Power problems**

Use this information to resolve issues related to power.

**System error LED is on and event log "Power supply has lost input" is displayed**

To resolve the problem, ensure that:

1. The power supply is properly connected to a power cord.
2. The power cord is connected to a properly grounded electrical outlet for the server.

**Network problems**

Use this information to resolve issues related to networking.

- “Cannot wake server using Wake on LAN” on page 158
- “Could not log in using LDAP account with SSL enabled” on page 159

**Cannot wake server using Wake on LAN**

Complete the following steps until the problem is resolved:
1. If you are using the dual-port network adapter and the server is connected to the network using Ethernet 5 connector, check the system-error log or IMM2 system event log (see “Event logs” on page 145), make sure:
   a. The room temperature is not too high (see “Specifications” on page 2).
   b. The air vents are not blocked.
   c. The air baffle is installed securely.
2. Reseat the dual-port network adapter.
3. Turn off the server and disconnect it from the power source; then, wait 10 seconds before restarting the server.
4. If the problem still remains, replace the dual-port network adapter.

**Could not log in using LDAP account with SSL enabled**

Complete the following steps until the problem is resolved:
1. Make sure that the license key is valid.
2. Generate a new license key and log in again.

**Observable problems**

Use this information to solve observable problems.

- “The server immediately displays the POST Event Viewer when it is turned on” on page 159
- “Server is unresponsive (POST is complete and operating system is running)” on page 159
- “Server is unresponsive (cannot press F1 to start System Setup)” on page 160
- “Voltage planar fault is displayed in the event log” on page 160
- “Unusual smell” on page 161
- “Server seems to be running hot” on page 161
- “Cracked parts or cracked chassis” on page 161

**The server immediately displays the POST Event Viewer when it is turned on**

Complete the following steps until the problem is solved.
1. Correct any errors that are indicated by the light path diagnostics LEDs.
2. Make sure that the server supports all the processors and that the processors match in speed and cache size.
   
   You can view processor details from system setup.
   
3. (Trained technician only) Make sure that processor 1 is seated correctly.
4. (Trained technician only) Remove processor 2 and restart the server.
5. Replace the following components one at a time, in the order shown, restarting the server each time:
   a. (Trained technician only) Processor
   b. (Trained technician only) System board

**Server is unresponsive (POST is complete and operating system is running)**

Complete the following steps until the problem is solved.

- If you are in the same location as the compute node, complete the following steps:
1. If you are using a KVM connection, make sure that the connection is operating correctly. Otherwise, make sure that the keyboard and mouse are operating correctly.
2. If possible, log in to the compute node and verify that all applications are running (no applications are hung).
3. Restart the compute node.
4. If the problem remains, make sure that any new software has been installed and configured correctly.
5. Contact your place of purchase of the software or your software provider.
   • If you are accessing the compute node from a remote location, complete the following steps:
     1. Make sure that all applications are running (no applications are hung).
     2. Attempt to log out of the system and log back in.
     3. Validate the network access by pinging or running a trace route to the compute node from a command line.
        a. If you are unable to get a response during a ping test, attempt to ping another compute node in the enclosure to determine whether it is a connection problem or compute node problem.
        b. Run a trace route to determine where the connection breaks down. Attempt to resolve a connection issue with either the VPN or the point at which the connection breaks down.
     4. Restart the compute node remotely through the management interface.
     5. If the problem remains, verify that any new software has been installed and configured correctly.
     6. Contact your place of purchase of the software or your software provider.

Server is unresponsive (cannot press F1 to start System Setup)

Configuration changes, such as added devices or adapter firmware updates, and firmware or application code problems can cause the server to fail POST (the power-on self-test).

If this occurs, the server responds in either of the following ways:
• The server restarts automatically and attempts POST again.
• The server hangs, and you must manually restart the server for the server to attempt POST again.

After a specified number of consecutive attempts (automatic or manual), the server to reverts to the default UEFI configuration and starts System Setup so that you can make the necessary corrections to the configuration and restart the server. If the server is unable to successfully complete POST with the default configuration, there might be a problem with the system board.

You can specify the number of consecutive restart attempts in System Setup. Restart the server and press F1 to display the Lenovo XClarity Provisioning Manager system setup interface. Then, click System Settings ➔ Recovery and RAS ➔ POST Attempts ➔ POST Attempts Limit. Available options are 3, 6, 9, and disable.

Voltage planar fault is displayed in the event log

Complete the following steps until the problem is solved.
1. Revert the system to the minimum configuration. See “Specifications” on page 2 for the minimally required number of processors and DIMMs.
2. Restart the system.
   • If the system restarts, add each of the items that you removed one at a time, restarting the system each time, until the error occurs. Replace the item for which the error occurs.
   • If the system does not restart, suspect the system board.
Unusual smell
Complete the following steps until the problem is solved.
1. An unusual smell might be coming from newly installed equipment.
2. If the problem remains, contact Lenovo Support.

Server seems to be running hot
Complete the following steps until the problem is solved.

Multiple compute nodes or chassis:
1. Make sure that the room temperature is within the specified range (see “Specifications” on page 2).
2. Check the management processor event log for rising temperature events. If there are no events, the compute node is running within normal operating temperatures. Note that you can expect some variation in temperature.

Cracked parts or cracked chassis
Contact Lenovo Support.

Software problems
Use this information to solve software problems.

1. To determine whether the problem is caused by the software, make sure that:
   • The server has the minimum memory that is needed to use the software. For memory requirements, see the information that comes with the software.

   Note: If you have just installed an adapter or memory, the server might have a memory-address conflict.
   • The software is designed to operate on the server.
   • Other software works on the server.
   • The software works on another server.

2. If you receive any error messages while you use the software, see the information that comes with the software for a description of the messages and suggested solutions to the problem.

3. Contact your place of purchase of the software.
Appendix A. Getting help and technical assistance

If you need help, service, or technical assistance or just want more information about Lenovo products, you will find a wide variety of sources available from Lenovo to assist you.

On the World Wide Web, up-to-date information about Lenovo systems, optional devices, services, and support are available at:

http://datacentersupport.lenovo.com

Note: IBM is Lenovo’s preferred service provider for ThinkSystem.

Before you call

Before you call, there are several steps that you can take to try and solve the problem yourself. If you decide that you do need to call for assistance, gather the information that will be needed by the service technician to more quickly resolve your problem.

Attempt to resolve the problem yourself

You can solve many problems without outside assistance by following the troubleshooting procedures that Lenovo provides in the online help or in the Lenovo product documentation. The Lenovo product documentation also describes the diagnostic tests that you can perform. The documentation for most systems, operating systems, and programs contains troubleshooting procedures and explanations of error messages and error codes. If you suspect a software problem, see the documentation for the operating system or program.

You can find the product documentation for your ThinkSystem products at the following location:

http://thinksystem.lenovofiles.com/help/index.jsp

You can take these steps to try to solve the problem yourself:

- Check all cables to make sure that they are connected.
- Check the power switches to make sure that the system and any optional devices are turned on.
- Check for updated software, firmware, and operating-system device drivers for your Lenovo product. The Lenovo Warranty terms and conditions state that you, the owner of the Lenovo product, are responsible for maintaining and updating all software and firmware for the product (unless it is covered by an additional maintenance contract). Your service technician will request that you upgrade your software and firmware if the problem has a documented solution within a software upgrade.
- If you have installed new hardware or software in your environment, check http://www.lenovo.com/us/en/serverproven/ to make sure that the hardware and software is supported by your product.
- Go to http://datacentersupport.lenovo.com and check for information to help you solve the problem.
  - Check the Lenovo forums at https://forums.lenovo.com/t5/Datacenter-Systems/ct-p/sv_egg to see if someone else has encountered a similar problem.

You can solve many problems without outside assistance by following the troubleshooting procedures that Lenovo provides in the online help or in the Lenovo product documentation. The Lenovo product documentation also describes the diagnostic tests that you can perform. The documentation for most systems, operating systems, and programs contains troubleshooting procedures and explanations of error messages and error codes. If you suspect a software problem, see the documentation for the operating system or program.
Gathering information needed to call Support

If you believe that you require warranty service for your Lenovo product, the service technicians will be able to assist you more efficiently if you prepare before you call. You can also see [http://datacentersupport.lenovo.com/warrantylookup](http://datacentersupport.lenovo.com/warrantylookup) for more information about your product warranty.

Gather the following information to provide to the service technician. This data will help the service technician quickly provide a solution to your problem and ensure that you receive the level of service for which you might have contracted.

- Hardware and Software Maintenance agreement contract numbers, if applicable
- Machine type number (Lenovo 4-digit machine identifier)
- Model number
- Serial number
- Current system UEFI and firmware levels
- Other pertinent information such as error messages and logs

As an alternative to calling Lenovo Support, you can go to [https://support.lenovo.com/servicerequest](https://support.lenovo.com/servicerequest) to submit an Electronic Service Request.Submitting an Electronic Service Request will start the process of determining a solution to your problem by making the pertinent information available to the service technicians. The Lenovo service technicians can start working on your solution as soon as you have completed and submitted an Electronic Service Request.

Collecting service data

To clearly identify the root cause of a server issue or at the request of Lenovo Support, you might need collect service data that can be used for further analysis. Service data includes information such as event logs and hardware inventory.

Service data can be collected through the following tools:

- **Lenovo XClarity Provisioning Manager**
  
  Use the Collect Service Data function of Lenovo XClarity Provisioning Manager to collect system service data. You can collect existing system log data or run a new diagnostic to collect new data.

- **Lenovo XClarity Controller**
  
  You can use the Lenovo XClarity Controller web interface or the CLI to collect service data for the server. The file can be saved and sent to Lenovo Support.
  - For more information about using the web interface to collect service data, see [http://sysmgt.lenovofiles.com/help/topic/com.lenovo.systems.management.xcc.doc/NN1ia_c_servicesandsupport.html](http://sysmgt.lenovofiles.com/help/topic/com.lenovo.systems.management.xcc.doc/NN1ia_c_servicesandsupport.html).
  - For more information about using the CLI to collect service data, see [http://sysmgt.lenovofiles.com/help/topic/com.lenovo.systems.management.xcc.doc/nn1ia_r_ffdccommand.html](http://sysmgt.lenovofiles.com/help/topic/com.lenovo.systems.management.xcc.doc/nn1ia_r_ffdccommand.html).

- **Lenovo XClarity Administrator**
  
  Lenovo XClarity Administrator can be set up to collect and send diagnostic files automatically to Lenovo Support when certain serviceable events occur in Lenovo XClarity Administrator and the managed endpoints. You can choose to send diagnostic files to Lenovo Support using Call Home or to another service provider using SFTP. You can also manually collect diagnostic files, open a problem record, and send diagnostic files to the Lenovo Support Center.

- **Lenovo XClarity Essentials OneCLI**
Lenovo XClarity Essentials OneCLI has inventory application to collect service data. It can run both in-band and out-of-band. When running in-band within the host operating system on the server, OneCLI can collect information about the operating system, such as the operating system event log, in addition to the hardware service data.

To obtain service data, you can run the `getinfor` command. For more information about running the `getinfor`, see [http://sysmgmt.lenovofiles.com/help/topic/toolsctr_cli_lenovo/onecli_r_getinfor_command.html](http://sysmgmt.lenovofiles.com/help/topic/toolsctr_cli_lenovo/onecli_r_getinfor_command.html).

**Contacting Support**

You can contact Support to obtain help for your issue.

You can receive hardware service through a Lenovo Authorized Service Provider. To locate a service provider authorized by Lenovo to provide warranty service, go to [https://datacentersupport.lenovo.com/serviceprovider](https://datacentersupport.lenovo.com/serviceprovider) and use filter searching for different countries. For Lenovo support telephone numbers, see [https://datacentersupport.lenovo.com/supportphonelist](https://datacentersupport.lenovo.com/supportphonelist) for your region support details.
Appendix B. Notices

Lenovo may not offer the products, services, or features discussed in this document in all countries. Consult your local Lenovo representative for information on the products and services currently available in your area.

Any reference to a Lenovo product, program, or service is not intended to state or imply that only that Lenovo product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any Lenovo intellectual property right may be used instead. However, it is the user’s responsibility to evaluate and verify the operation of any other product, program, or service.

Lenovo may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document is not an offer and does not provide a license under any patents or patent applications. You can send inquiries in writing to the following:

Lenovo (United States), Inc.
1009 Think Place
Morrisville, NC 27560
U.S.A.
Attention: Lenovo VP of Intellectual Property

LENOVO PROVIDES THIS PUBLICATION “AS IS” WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some jurisdictions do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. Lenovo may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

The products described in this document are not intended for use in implantation or other life support applications where malfunction may result in injury or death to persons. The information contained in this document does not affect or change Lenovo product specifications or warranties. Nothing in this document shall operate as an express or implied license or indemnity under the intellectual property rights of Lenovo or third parties. All information contained in this document was obtained in specific environments and is presented as an illustration. The result obtained in other operating environments may vary.

Lenovo may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Any references in this publication to non-Lenovo s are provided for convenience only and do not in any manner serve as an endorsement of those s. The materials at those s are not part of the materials for this Lenovo product, and use of those s is at your own risk.

Any performance data contained herein was determined in a controlled environment. Therefore, the result obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.
Trademarks

LENOVO, XCLARITY, and THINKSYSTEM are trademarks of Lenovo.

Intel and Xeon are trademarks of Intel Corporation in the United States, other countries, or both.

Microsoft and Windows are trademarks of the Microsoft group of companies.

Linux is a registered trademark of Linus Torvalds.

All other trademarks are the property of their respective owners. © 2020 Lenovo.

Important notes

Processor speed indicates the internal clock speed of the processor; other factors also affect application performance.

CD or DVD drive speed is the variable read rate. Actual speeds vary and are often less than the possible maximum.

When referring to processor storage, real and virtual storage, or channel volume, KB stands for 1 024 bytes, MB stands for 1 048 576 bytes, and GB stands for 1 073 741 824 bytes.

When referring to hard disk drive capacity or communications volume, MB stands for 1 000 000 bytes, and GB stands for 1 000 000 000 bytes. Total user-accessible capacity can vary depending on operating environments.

Maximum internal hard disk drive capacities assume the replacement of any standard hard disk drives and population of all hard-disk-drive bays with the largest currently supported drives that are available from Lenovo.

Maximum memory might require replacement of the standard memory with an optional memory module.

Each solid-state memory cell has an intrinsic, finite number of write cycles that the cell can incur. Therefore, a solid-state device has a maximum number of write cycles that it can be subjected to, expressed as total bytes written (TBW). A device that has exceeded this limit might fail to respond to system-generated commands or might be incapable of being written to. Lenovo is not responsible for replacement of a device that has exceeded its maximum guaranteed number of program/erase cycles, as documented in the Official Published Specifications for the device.

Lenovo makes no representations or warranties with respect to non-Lenovo products. Support (if any) for the non-Lenovo products is provided by the third party, not Lenovo.

Some software might differ from its retail version (if available) and might not include user manuals or all program functionality.

Particulate contamination

Attention: Airborne particulates (including metal flakes or particles) and reactive gases acting alone or in combination with other environmental factors such as humidity or temperature might pose a risk to the device that is described in this document.

Risks that are posed by the presence of excessive particulate levels or concentrations of harmful gases include damage that might cause the device to malfunction or cease functioning altogether. This
specification sets forth limits for particulates and gases that are intended to avoid such damage. The limits must not be viewed or used as definitive limits, because numerous other factors, such as temperature or moisture content of the air, can influence the impact of particulates or environmental corrosives and gaseous contaminant transfer. In the absence of specific limits that are set forth in this document, you must implement practices that maintain particulate and gas levels that are consistent with the protection of human health and safety. If Lenovo determines that the levels of particulates or gases in your environment have caused damage to the device, Lenovo may condition provision of repair or replacement of devices or parts on implementation of appropriate remedial measures to mitigate such environmental contamination. Implementation of such remedial measures is a customer responsibility.

Table 20. Limits for particulates and gases

<table>
<thead>
<tr>
<th>Contaminant</th>
<th>Limits</th>
</tr>
</thead>
</table>
| **Particulate** | • The room air must be continuously filtered with 40% atmospheric dust spot efficiency (MERV 9) according to ASHRAE Standard 52.2\(^1\).  
  • Air that enters a data center must be filtered to 99.97% efficiency or greater, using high-efficiency particulate air (HEPA) filters that meet MIL-STD-282.  
  • The deliquescent relative humidity of the particulate contamination must be more than 60%\(^2\).  
  • The room must be free of conductive contamination such as zinc whiskers. |
| **Gaseous** | • Copper: Class G1 as per ANSI/ISA 71.04-1985\(^3\)  
  • Silver: Corrosion rate of less than 300 Å in 30 days |

---

2 The deliquescent relative humidity of particulate contamination is the relative humidity at which the dust absorbs enough water to become wet and promote ionic conduction.

---

**Telecommunication regulatory statement**

This product may not be certified in your country for connection by any means whatsoever to interfaces of public telecommunications networks. Further certification may be required by law prior to making any such connection. Contact a Lenovo representative or reseller for any questions.

**Electronic emission notices**

When you attach a monitor to the equipment, you must use the designated monitor cable and any interference suppression devices that are supplied with the monitor.

Additional electronic emissions notices are available at:

Taiwan BSMI RoHS declaration

備考1. “超出0.1 wt%”及“超出0.01 wt%”係指限用物質之百分比含量超出百分比含量基準值。
Note1: “exceeding 0.1 wt%” and “exceeding 0.01 wt%” indicate that the percentage content of the restricted substance exceeds the reference percentage value of presence condition.

備考2. “○”係指該項限用物質之百分比含量未超出百分比含量基準值。
Note2: “○” indicates that the percentage content of the restricted substance does not exceed the percentage of reference value of presence.

備考3. “-”係指該項限用物質為排除項目。
Note3: The “-” indicates that the restricted substance corresponds to the exemption.
